FinanceAI Sample Use Case Slideware

Last Updated: Septemberer 2026

FinanceAI Sample Use Case Slideware

HOW TO USE

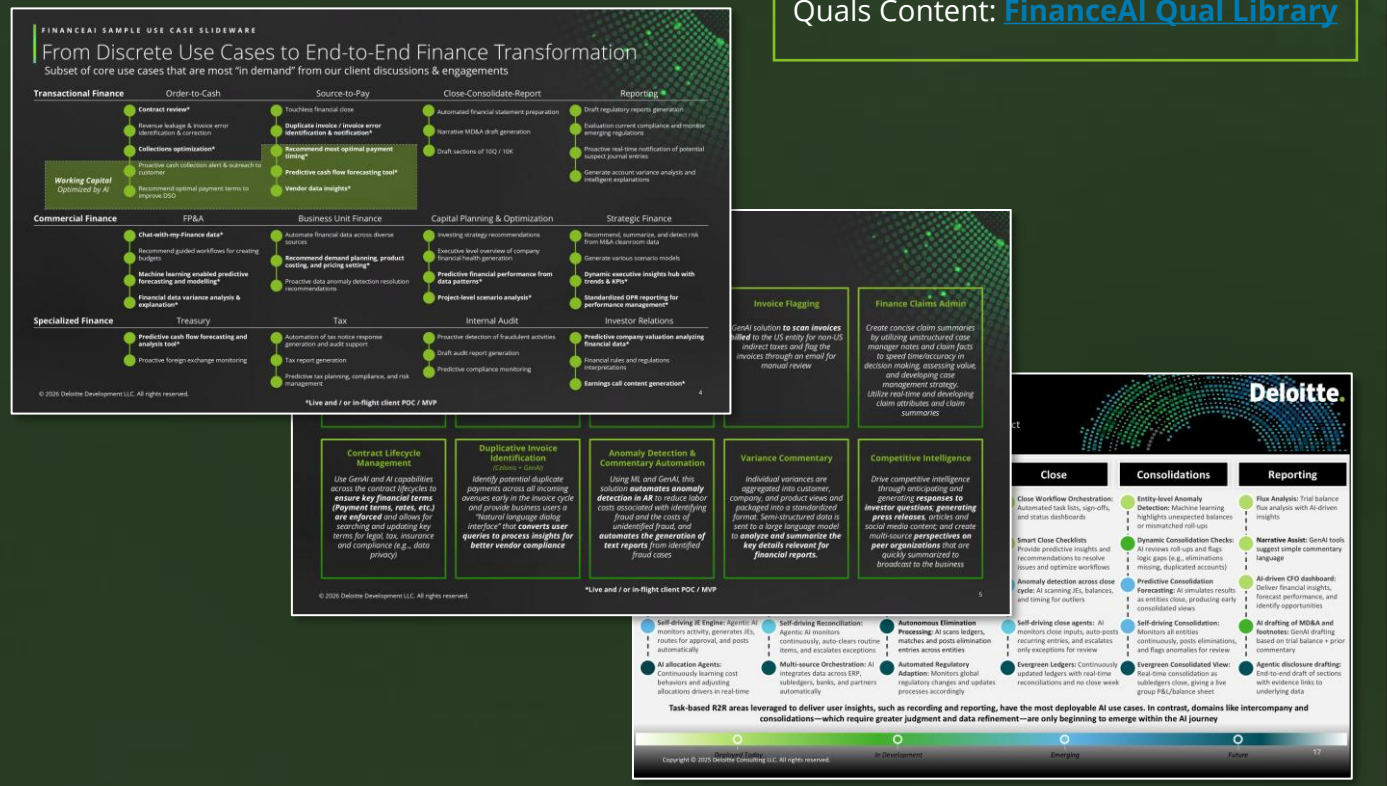

Leverage this presentation as your source for ready to use "use case" slides for FinanceAI

Need client-ready use case slides for your FinanceAI conversations?

Slideware on:

- ✓ End-to-End Finance Use Cases
- ✓ Process-Specific Use Cases
- ✓ Industry-Specific Use Cases

Quals Content: [FinanceAI Qual Library]

From Discrete Use Cases to End-to-End Finance Transformation

Core use cases most "in demand" from client discussions & engagements, all live and / or in-flight client POCs / MVPs

Transactional Finance

Order-to-Cash

- Contract review
- Revenue leakage & invoice error identification & correction
- Collections optimization
- Proactive cash collection alert & outreach to customer
- Recommend optimal payment terms to improve DSO

Working Capital
Optimized by AI

Source-to-Pay

- Touchless financial close
- Duplicate invoice / invoice error identification & notification
- Recommend most optimal payment timing
- Predictive cash flow forecasting tool
- Vendor data insights

Close-Consolidate-Report

- Automated financial statement preparation
- Narrative MD&A draft generation
- Draft sections of 10Q / 10K

Reporting

- Draft regulatory reports generation
- Evaluation current compliance and monitor emerging regulations
- Proactive real-time notification of potential suspect journal entries
- Generate account variance analysis and intelligent explanations

Commercial Finance

FP&A

- Chat-with-my-Finance data
- Recommend guided workflows for creating budgets
- Machine learning enabled predictive forecasting and modelling
- Financial data variance analysis & explanation

Business Unit Finance

- Automate financial data across diverse sources
- Recommend demand planning, product costing, and pricing setting
- Proactive data anomaly detection resolution recommendations

Capital Planning & Optimization

- Investing strategy recommendations
- Executive level overview of company financial health generation
- Predictive financial performance from data patterns
- Project-level scenario analysis

Strategic Finance

- Generate various scenario models
- Dynamic executive insights hub with trends & KPIs
- Standardized OPR reporting for performance management

Specialized Finance

Treasury

- Predictive cash flow forecasting and analysis tool
- Treasury Risk & Anomaly Detection
- Payment routing optimization
- Payment reconciliation

Tax

- Automation of tax notice response generation and audit support
- Tax report generation
- Predictive tax planning, compliance, and risk management

Internal Audit

- Proactive detection of fraudulent activities
- Draft audit report generation
- Predictive compliance monitoring

Investor Relations

- Predictive company valuation analyzing financial data
- Financial rules and regulations interpretations
- Earnings call content generation

Live Use Cases Available

CFO Insights for FP&A

Interpret and convert natural language queries from users and produce data in the format of text, tables or graphs to Interpret and ***learn the terminology that the FP&A and CFO org uses***

AP Assistant

GenAI chatbot that can assist users with ***enhanced vendor master data insights, accelerated invoice payment process and optimizing purchasing process*** *with a Microsoft Teams front end providing ability to talk to the data*

IR Earnings Assistant

GenAI solution that aims to ***enhance the preparation of key spokespeople for earnings calls*** *by generating potential questions that financial analysts may pose*

Invoice Flagging

GenAI solution ***to scan invoices billed*** *to the US entity for non-US indirect taxes and flag the invoices through an email for manual review*

Finance Claims Admin

Create concise claim summaries by utilizing unstructured case manager notes and claim facts to speed time/accuracy in decision making, assessing value, and developing case management strategy. Utilize real-time and developing claim attributes and claim summaries

Contract Lifecycle Management

Use GenAI and AI capabilities across the contract lifecycles to ***ensure key financial terms (Payment terms, rates, etc.) are enforced*** *and allows for searching and updating key terms for legal, tax, insurance and compliance (e.g.., data privacy)*

Duplicative Invoice Identification

(Celonis + GenAI)

Identify potential duplicate payments across all incoming avenues early in the invoice cycle and provide business users a "Natural language dialog interface" that ***converts user queries to process insights for better vendor compliance***

Anomaly Detection & Commentary Automation

Using ML and GenAI, this solution ***automates anomaly detection in AR*** *to reduce labor costs associated with identifying fraud and the costs of unidentified fraud, and* ***automates the generation of text reports*** *from identified fraud cases*

Variance Commentary

Individual variances are aggregated into customer, company, and product views and packaged into a standardized format. Semi-structured data is sent to a large language model to ***analyze and summarize the key details relevant for financial reports.***

Competitive Intelligence

Drive competitive intelligence through anticipating and generating ***responses to investor questions****;* ***generating press releases****, articles and social media content; and create multi-source* ***perspectives on peer organizations*** *that are quickly summarized to broadcast to the business*

***Live and / or in-flight client POC / MVP**

Additional Use Cases

ADDITIONAL USE CASES

Examples of AI Agents being Built and Utilized in Select Finance Functions

Expense Management

Automated Expense Classification and Validation

AI Agent automatically classifies expenses by category (travel, supplies, utilities) using natural language processing (NLP) and image recognition.

Intelligent Expense Approval Workflow

AI Agent manages the approval workflow for expense reports, ensuring compliance with company policies.

Expense Analytics and Insights

Ai Agent provides real-time insights on spending trends, identifying areas for cost optimization.

Proactive Expense Fraud Detection

AI Agent detects and flags suspicious expense patterns for review.

Profitability Management

Profitability Analysis

AI Agent automatically analyzes profitability across different products, services, or customer segments.

Automated Profitability Reporting

AI Agent generates profitability reports for management, including insights on high and low-performing areas.

Intelligent Scenario Simulation

AI Agent supports finance teams to simulate the impact of various scenarios on profitability (e.g., cost increases, price changes).

Intelligent Profitability Benchmarking

AI Agent accesses external financial reports and industry data, comparing your margins, operating costs, and profitability ratios.

AP & AR

Automated Invoice Processing and Approval

AI Agent automatically reads, categorizes, and approves invoices based on predefined rules.

Dynamic Payment Scheduling Optimization

AI Agent recommends the best payment dates to optimize cash flow, taking into account discounts and payment terms.

Fraud Detection

AI Agent monitors AP transactions in real-time, flagging suspicious invoices, duplicate payments, or unusual vendor activity.

Conversational Query Resolution (AP Assistant)

AI Agent cts as a virtual assistant, answering queries from vendors or internal teams about payment status.

Financial Reporting

Data Consolidation and Validation

AI Agent automatically consolidates financial data from multiple sources (subsidiaries, departments) and checks for consistency.

Automated Financial Narrative Generation (MD&A)

AI Agent generates the Management Discussion and Analysis (MD&A) section of financial reports.

Error Detection and Correction

AI Agent identifies common reporting errors (e.g., rounding errors, missing values) and provides correction suggestions.

Financial Dashboard Creation

AI Agent visualizes KPIs (revenue, expenses, profit margins) and allows for drill-down analysis.

The latest FinanceAI Enabled E2E Processes can be found HERE

ADDITIONAL USE CASES

AI production use cases are beginning to emerge in Finance

IR Earnings Assistant

Earnings call prep

GenAI solution that enhances the preparation of key spokespeople for earnings calls by generating potential questions that financial analysts may pose

IR Competitive Intelligence

Competitor insight

Assess competitive intelligence through analysis of external public information on competitors, trawling large unstructured datasets for specific insights

FinanceAI Analyst / Copilot for FP&A

Natural-language queries

Interpret and convert natural language queries from users and produce data in the format of text, tables or graphs to Interpret and learn the terminology that the FP&A and CFO org uses

Variance Commentary

Report narratives

Individual variances are aggregated into customer, company, and product views and packaged into a standardized format. Data is sent to a large language model to analyze and summarize the key details relevant for financial reports.

Contract Lifecycle Mgmt

Contract generation

GenAI/AI capabilities across the contract lifecycles to generate contracts and check key financial terms.

AP Assistant

Payables chatbot

GenAI chatbot that assists users with enhanced vendor master data insights, accelerated invoice payment process and optimizing purchasing process with a Chat front end providing ability to talk to the data

Anomaly Detection

AR fraud detection

Using AI to automates anomaly detection in AR to reduce labor costs associated with identifying fraud and the costs of unidentified fraud, and automates the generation of text reports from identified fraud cases

Duplicative Invoice identification

Duplicate payments

Identify potential duplicate payments across all incoming avenues early in the invoice cycle

Invoice Flagging

Indirect tax review

GenAI solution to scan invoices billed to the US entity for non-US indirect taxes and flag the invoices through an email for manual review

© 2026 Deloitte Development LLC. All rights reserved.

Use Cases: Digital Project Controller

About

- **Use Case:** Deploy digital assistant to enable financial project mgmt. activities, such as pricing, forecasting, and budget vs. actual variance analysis.
- **Pain Points:**
  - Supporting forecasting & scenario analysis depends on controller and is highly manual.
  - Tailored reporting and is labor-intensive and time consuming.
  - Significant time is spent to explain the impact of accounting and policy on financial results.

Solution Highlights

Expected capacity creation impact of 10-15% on an organization of 1,000 FTEs.

Resources can be redeployed to perform more strategic work; firm can hire less while meeting growth needs.

Technology enables work for both project controllers (“supply side”) and project managers (“demand side”).

Improves controls across the firm through faster and more consistent access to firm policy & procedures.

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Cases: Journal Entry Automation

About

- **Use Case:** Automate upstream journal entry preparation by centralizing data ingestion, rules-based reconciliation, exception review, approval routing, and JE generation while keeping existing posting controls unchanged.
- **Pain Points:**
  - Supporting data must be pulled from multiple source systems and files, creating recurring manual effort each close cycle.
  - Spreadsheet-based filtering, lookups, and reconciliation increase error risk and depend on macros and manual review.
  - Approval handoffs happen by email, which slows turnaround and weakens traceability.
  - Manual JE template population and after-the-fact evidence packaging increase close risk in a high-value control area

Solution Highlights

Expected automation impact of ~75% across upstream preparation activities.

Close-cycle effort can be reduced by 50–65% across targeted MJE data analysis processes.

Structured approval workflow replaces email-driven coordination and improves traceability.

Reusable capabilities can scale across future MJE processes without rebuilding the framework.

© 2026 Deloitte Development LLC. All rights reserved.

Use Cases: Gen AI-Enabled Invoice Management

About

- **Use Case:** Automate invoice matching, processing, and payment activities to reduce headcount in the client's Finance offshore center operated by Deloitte.
- **Pain Points:**
  - Data quality from sources/invoice capturing requires significant human intervention.
  - Current process is template dependent which results in high exception rate.
  - Access to information on vendors and payables is manual and time consuming with no clear source of truth.

Solution Highlights

20% FTE savings from addressable base in the broker's offshore center.

Feedback loop learns from manual exception handling to improve invoice matching over time.

Gen AI chatbot built into the engagement layer enables access to information and enhances reporting quality.

Deloitte's AIOPS.D delivers a secure *Gen AI-as-a-Service* model, reducing complexity and expediting TTM.

© 2026 Deloitte Development LLC. All rights reserved.

Use Cases: Statutory Reporting Automation – AHPEE

About

- **Use Case:** Automate data sourcing, calculations, formatting, and creation of a statutory exhibit (AHPEE).
- Gen AI platform enables additional use cases besides this statutory report.
- **Pain Points:**
  - Process is dependent on few individuals who are nearing retirement.
  - Limited data integration requires manual work to perform reporting.
  - Reporting is prone to errors due to hard-coded values/calculations in excel and users manually maintain mappings.

Solution Highlights

Direct savings of 1.5 (expensive) FTEs; potential to expand the solution to additional FTEs.

Gen AI-as-a-Platform model, with capabilities embedded in a workflow tool for business users.

Helps mitigate key person risk while capturing and building out critical institutional knowledge.

Multiple capabilities proven through the use case, such as sourcing data from non-GL systems, mapping and handling structured and unstructured data, and more.

© 2026 Deloitte Development LLC. All rights reserved.

Use Cases: Finance FP&A Assistant

About

- **Use Case:** Analyze data and produce insights on natural language queries using organization terminology/formats.
- **Pain Points:**
  - Financial analysis and ad-hoc reporting processes done mostly offline and is labor-intensive.
  - Low traceability due to manual sourcing from multiple systems.
  - Fixed values in excels and reliance on key individuals increase risk of errors.

Solution Highlights

Connect, maps, and handle data from ERP and non-ERP sources.

Gen AI learns the context of the FP&A function to improve responses and outputs.

Interpret natural language queries from users and produce data in text, tables and graphs.

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI-Powered Use Cases Across R2R

AI's potential is reshaping R2R pillars and processes, driving measurable impact

Recording

- **Accrual Prediction Models:** AI forecasting accrual amounts based on historical spend and activity
- **JE Anomaly Detection:** Models flagging unusual debits/credits, account/cost center mismatches, etc.
- **JE Enrichment:** Adding missing detail based on patterns in historical entries
- **Self-driving JE Engine:** Agentic AI monitors activity, generates JEs, routes for approval, and posts automatically
- **AI allocation Agents:** Continuously learning cost behaviors and adjusting allocations drivers in real-time

Reconciliation

- **Automated Transaction Matching:** AI/ML to match non-exact items (e.g., bank vs GL, invoice vs payment)
- **Anomaly Detection:** Flagging outlier balances or transactions that don't fit historical patterns
- **Predictive Reconciliation Resolution:** Suggesting likely clearing entries or offsets before humans investigate
- **Self-driving Reconciliation:** Agentic AI monitors continuously, auto-clears routine items, and escalates exceptions
- **Multi-source Orchestration:** AI integrates data across ERP, subledgers, banks, and partners automatically

Intercompany

- **Intercompany Settlement Anomaly Detection:** Machine learning flags unusual patterns in intercompany transactions
- **Cross-Entity Invoice Matching:** AI matches invoices and payments between entities
- **Transaction-Based Task Routing:** AI analyzes transaction patterns to assign reconciliations properly
- **Autonomous Elimination Processing:** AI scans ledgers, matches and posts elimination entries across entities
- **Automated Regulatory Adaption:** Monitors global regulatory changes and updates processes accordingly

Close

- **Close Workflow Orchestration:** Automated task lists, sign-offs, and status dashboards
- **Smart Close Checklists** Provide predictive insights and recommendations to resolve issues and optimize workflows
- **Anomaly detection across close cycle:** AI scanning JEs, balances, and timing for outliers
- **Self-driving close agents:** AI monitors close inputs, auto-posts recurring entries, and escalates only exceptions for review
- **Evergreen Ledgers:** Continuously updated ledgers with real-time reconciliations and no close week

Consolidations

- **Entity-level Anomaly Detection:** Machine learning highlights unexpected balances or mismatched roll-ups
- **Dynamic Consolidation Checks:** AI reviews roll-ups and flags logic gaps (e.g., eliminations missing, duplicated accounts)
- **Predictive Consolidation Forecasting:** AI simulates results as entities close, producing early consolidated views
- **Self-driving Consolidation:** Monitors all entities continuously, posts eliminations, and flags anomalies for review
- **Evergreen Consolidated View:** Real-time consolidation as subledgers close, giving a live group P&L/balance sheet

Reporting

- **Flux Analysis:** Trial balance flux analysis with AI-driven insights
- **Narrative Assist:** GenAI tools suggest simple commentary language
- **AI-driven CFO dashboard:** Deliver financial insights, forecast performance, and identify opportunities
- **AI drafting of MD&A and footnotes:** GenAI drafting based on trial balance + prior commentary
- **Agentic disclosure drafting:** End-to-end draft of sections with evidence links to underlying data

Task-based R2R areas leveraged to deliver user insights, such as recording and reporting, have the most deployable AI use cases. In contrast, domains like intercompany and consolidations—which require greater judgment and data refinement—are only beginning to emerge within the AI journey

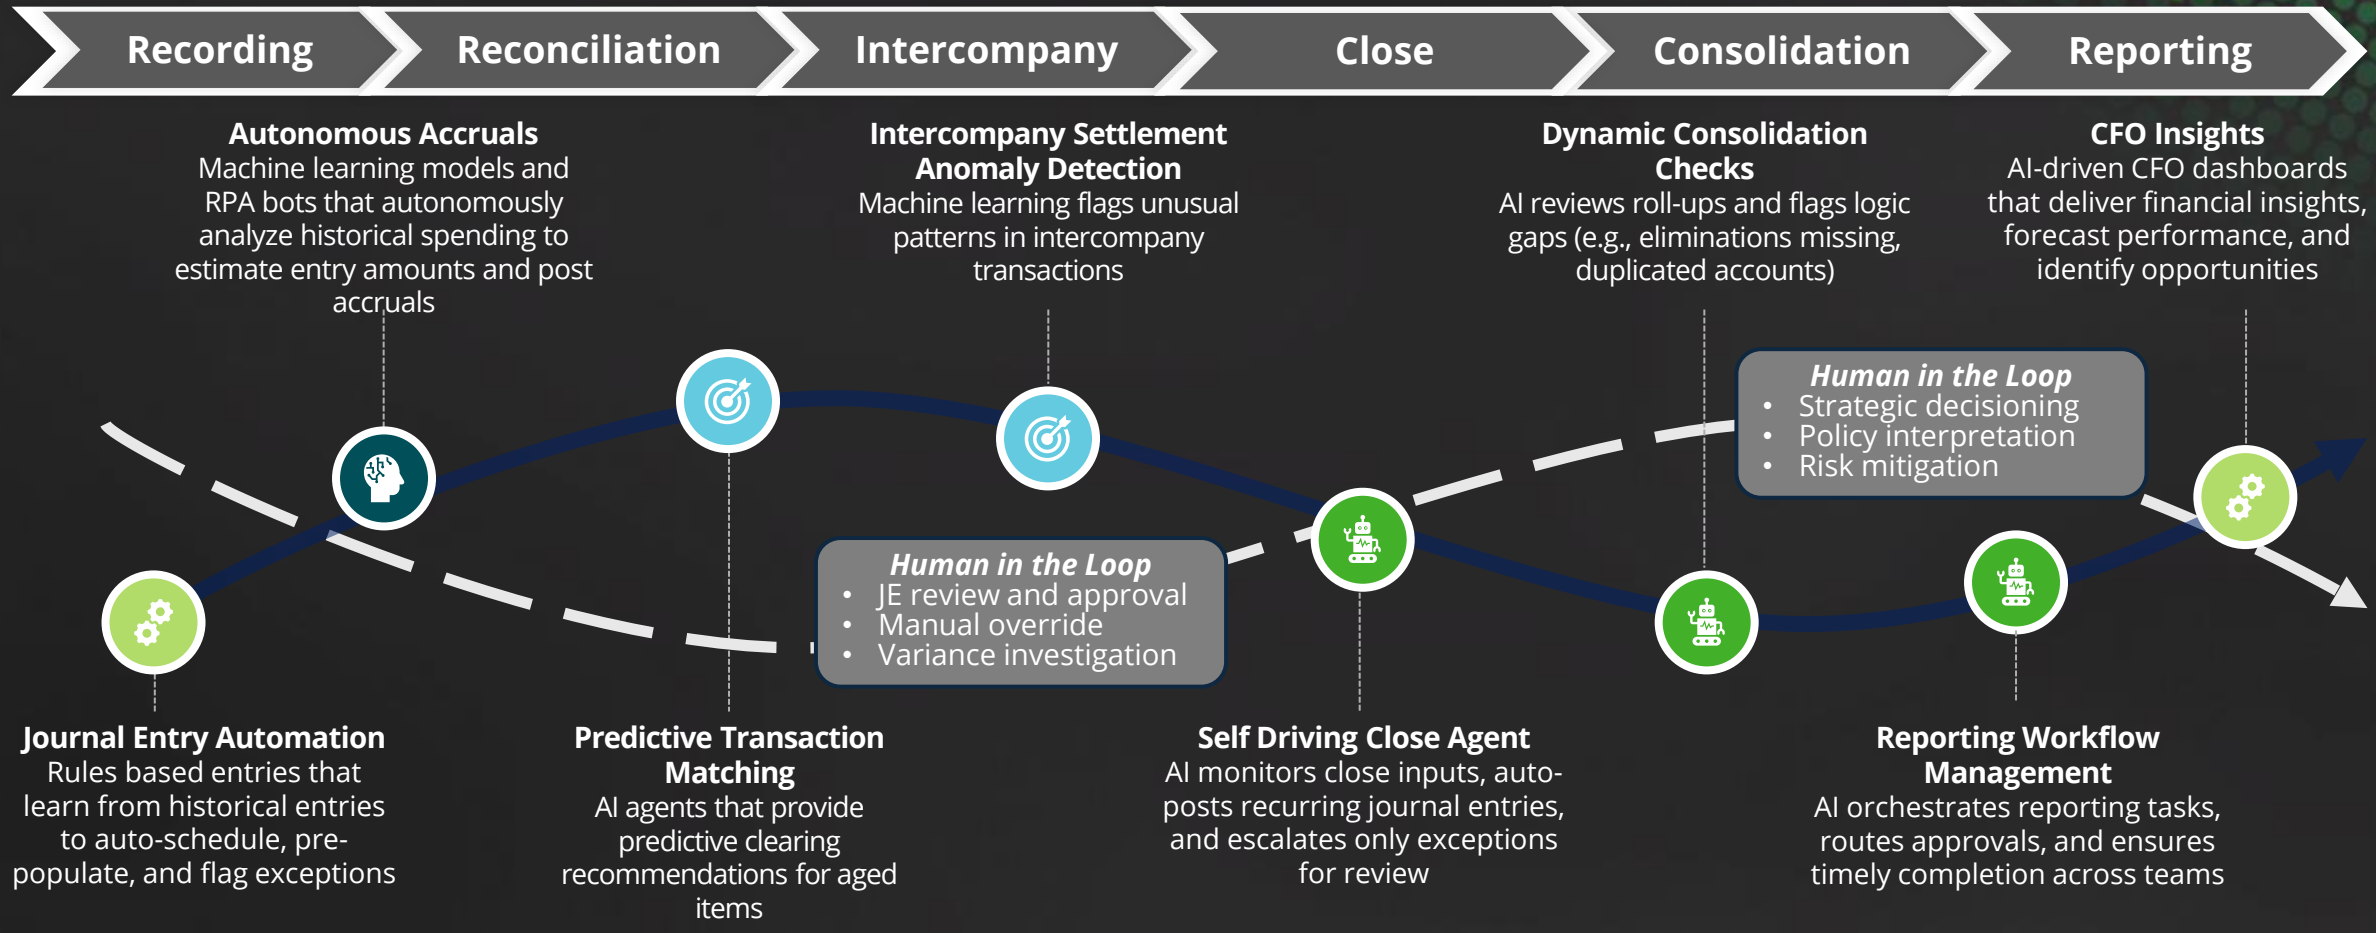

Deployed Today — *In Development* — *Emerging* — *Future*

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

End-to-End Agentic R2R Process Flow

A reimagined, AI-driven R2R multi-agent system enables smarter processes, enhanced decision-making, and an agile finance function

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Record to report Optimization – Journal Entry Automation

Automating the creation of the journal entry processes leveraging generative AI to engage and gather details used to develop journal entries that would normally occur via emails or close meetings

Situation

- Closing timelines are tight and exasperated with emails and meetings to complete tasks to adjust, consolidate, and explain variances across the business
- Limited calendar openings that place stress on close milestones and compliance
- Inconsistency and siloed systems, metadata and business changes restrict the flow of information needed to be reflected in internal and external reporting

Business Objectives

- Automate the information gathering requirements to prepare AJEs (e.g., accruals for GR/IR, contracts spanning multiple periods)
- Spend more time analyzing variances from prior periods
- Automate data gathering, increase productivity
- Accounting to be able to accommodate the increasing complexity as the business grows
- Increased transparency to auditors
- Better financial insights and decision-making

Solution Approach

- Train a Gen AI model to collect historical patterns, closing activities and stakeholders
- Define business and functional stakeholders to engage for closing activities
- Clean and preprocess input data
- Engage stakeholders to develop and document AJEs and narratives for reporting
- Summarize, document, and send proposed AJEs to applicable Accounting team

Potential Benefits

- **Quicker time to close**
- **Documented support,** through the AI generated conversations with business and functions
- **Reduced workload** for key resources during monthly/quarterly close
- **Foundational data gathering for reporting** and variance inferences
- **Reliable audit trail**, enabling better traceability
- **AJE validation meetings are minimized**, allowing the team more time to analyze and interpret results

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Mgmt Reporting – Actuals, Plan, Variance + Commentary Production

Produce management reporting & analysis on demand in any medium including insights and commentary

Situation

- Finance business partners spend more time evaluating data than generating insights
- Developing goal seek scenarios is a time consuming and labor-intensive process
- Even for relatively simple level 0 tasks, multiple stakeholders need to be involved in gathering accurate information

Business Objectives

- Produce first-draft insights and commentary on demand
- Conduct variance analysis and/or data reconciliation between multiple systems automatically
- Generate automated data visualizations with supporting commentary
- Recommend paths for different business management decisions
- Autonomous self-help and user-retrieved information based off prompts

Solution Approach

- Gather integrated financial/operational datasets from known data sources
- Connect data sources and LLM to an orchestration layer
- Define terminology necessary for LLM to understand the datasets
- Train model on correct terminology and update
- Generate data visualizations and corresponding commentary from the orchestration layer
- Highly dependent on client data maturity, common financial language, and standardization

Potential Benefits

- **Enhanced and complete data analysis** enabled by generative AI models that can analyze large volumes of data in short timeframes
- **Fully-autonomous management reporting** from data collation/reconciliation to commentary and insight creation
- **Enhanced decision support** leveraging virtual finance assistants to inform managers with data-driven decisions

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Planning and Forecasting

Provide end users with on demand forecasting and scenario modeling functionality with complete parameters and drivers flexibility

Situation

- Finance teams spend significant amounts of time during critical periods to produce and analyze scenarios requested by finance executives
- Merging internal and external datasets (especially operational vs. financial) to accurately generate scenarios is difficult and time consuming
- Manually developing a detailed forecast can take too long to be useful

Business Objectives

- Quickly generate financial forecasts based on real time business scenarios
- Increase the speed of delivery for FP&A modeling
- Utilize the current forecasting toolset to create scenarios that match plan/budget
- Generation of real-time suggested actions based on the sync of daily financial and operational data

Solution Approach

- Identify: Determine the variables to forecast or model
- Collect & Clean Data: Gather and preprocess historical data
- Build & Train Model: Develop and train a predictive or generative AI model
- Validate & Adjust: Test the model on unseen data and refine as needed
- Implement & Monitor: Deploy the model, monitor performance, and make updates
- Iterate: Continually revise and improve the model with new data and insights

Potential Benefits

- **Improved efficiency** due to fewer FTEs required; faster results
- **Deliver insight** by iteratively interacting with a GenAI model to quickly describe, evaluate and modify scenarios with real data
- **Drive transparency** by Identifying/understanding various assumptions and outcomes of scenarios
- **Use common-language** to automatically generate financial drivers that feed financial models

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Finance AI Digital Analyst

Perform analysis & investigation, and provide 1st order insights on demand from multiple financial sources

Situation

- Significant human time and effort is consumed, analyzing and summarizing financial performance data and reports
- Financial insights can be out-of-date, subjective, or narrowly sourced
- Generative AI can reduce human-ware and latency in insight delivery

Business Objectives

- Provide financial analysts access to generative AI capabilities in concert with their financial language and data
- Querying the insights platform would provide forward-looking and current insights, analysis, data and commentary based on the latest financial information of the client
- This capability would drive data-driven decision-making across the client's organization, and support ad hoc analysis and questions

Solution Approach

- Generative AI / LLM enabled solution
- Interaction layer to converse with the financial analyst
- Orchestration layer to manage interactions and access to key data sets
- Generative AI / LLM model to perform analysis, summarization, insight generation, report production, and data provisioning
- Train/tune the model based on client's financial language, context, and parameters
- API into financial applications for data sourcing

Potential Benefits

- **On demand access to information for finance professionals**, and possibly their customers to perform self-service for information and insights
- **Enhanced, economic decision making** leveraging up-to-date financial information and insights
- **Reduced reliance on human-ware** in ad hoc financial reporting and analysis processes
- **Reduced latency for available actionable financial information** for client decision-making
- **Lower cost to achieve leveraging Generative AI models** vs. traditional automation approaches

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Shared Services Interaction Layer – Intake / Automation

Provide a conversational AI (chatbot) interaction layer where employees can request any services based on free-form request

Situation

- Shared services customer experience is not consistent due to multiple channels of engagement and limited self- service capability
- Knowledge articles are stalled, not personalized and not easy to identify
- Shared services customers have very limited visibility into case status, resulting in ~30% increase in call volume

Business Objectives

- Design persona-based customer engagement model to deliver personalized, consistent experience
- Simplify workflows and interaction models
- leveraging technology, automation and AI
- Exploit data-driven insights, analytics and dashboard to drive performance and improve customer retention

Solution Approach

- Design Persona-based Interface and Workflow based on user journey and the moments that matter
- Define customer intake channel strategy and refresh knowledge article based on customer persona and journey map
- Integrate AI capability and machine translation to customer engagement channels virtual agent (chatbot) that can provider personalized services based on persona and defined knowledge articles to improve self- service and triage/first call resolution and status dashboard
- Track user feedback and volumetrics to inform continuous improvement and data driven customer retention strategy

Potential Benefits

- **Efficiency:** Improve productivity through optimizing technology stack and digitizing workflows powered by AI
- **Effectiveness:** Increase ROI in workflow efficiency through streamlined and effective cross functional collaboration
- **Experience:** Increase in customer satisfaction and improve call deflection in call volume through intelligent self-service and coordinated service management

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Assessment of use case portfolio shows low penetration across the business and functions

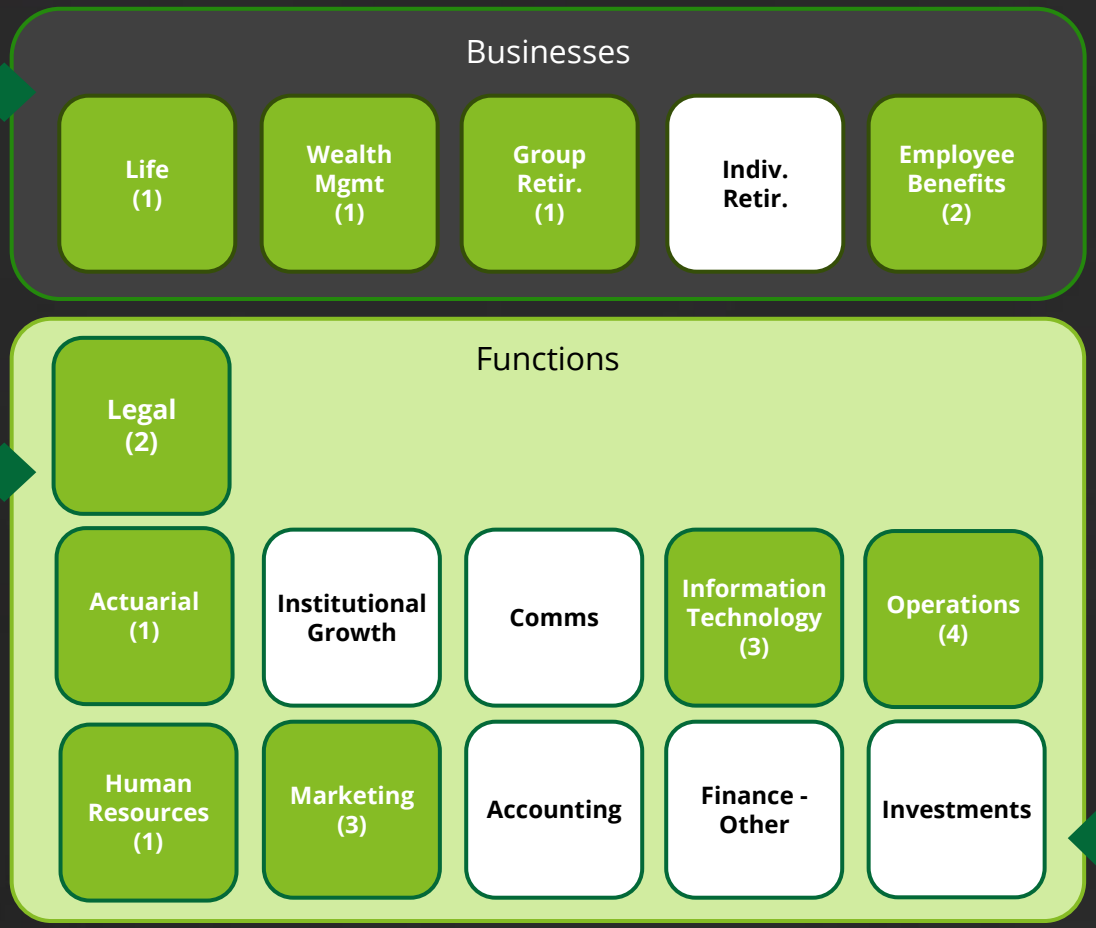

Life

- Leverage AI to for **compliance red flags** in the client performance reporting issued by Equitable Advisors
- **Redact sensitive information** from documents

Legal

- Leverage AI to **for compliance red flags** in the client performance reporting issued by Equitable Advisors
- **Redact sensitive information** from documents

19 Use Cases[1] in portfolio from 63% of GenAI Business focus areas[2]

Operations

- Assess if GenAI can provide **better answers for CSR's on questions about product information**. Today the Shelf tool is used to store and search these documents
- Analyze **operations call transcripts** to determine more granular call intent data and allow operations management to query transcripts
- Ability to **upload .pdf document** and get a summary and ask natural language questions of .pdf content
- Create a version of the **knowledge management solution** that can be easily expanded to other document repositories with reduced IT involvement

Legend:
Use Case(s) In Inventory
No Active Use Case

1. 8 of the 19 use cases have been moved to Production, 8 are in the Evolve stage, 1 is Awaiting Business, 1 is In IT Review, and 1 is Not Started
2. The use cases were aligned to the Equitable Business focus areas based on previous knowledge and the use case descriptions

ADDITIONAL USE CASES

<Co....>™ Perform Case Studies

	KEY BUSINESS ISSUE	SOLUTION	IMPACT
Case Study 1: Procurement Requisition Advisor	• Manually verifying policy and procedures are followed across 9+ business rules. • Reviewing attachment accuracy for all orders >$100K • Ensuring contract compliance and sourcing requirements	Through the **<Co.....>™ Perform** platform, gap was bridged with cloud-based AI/ML capabilities to optimize the business process and improve the human experience without incurring additional employee overhead costs, creating business value	• Reduced PR-to-PO cycle time by an average of 66% • Improved Touchless Requestions by 70%
Case Study 2: Perform Invoice Management	• Over 2 million invoices a year processed through heavy manually intensive steps • Assigning invoices to the correct accounting & master data to ensure proper payment • Keying in invoices and correcting errors from scanned invoices.	AP team was able to automate invoice processing using next-gen technology and analytics to accelerate invoice cycle times. The **ZORA AI™ Perform** invoice management AI Agents extracted the invoice information from multiple formats, automatically code the invoice fields, validate and automatically submit the invoice for approvals.	• Decreased cycle time - 1.7 Invoices processed per second with significant error reduction • $68B/year of invoice payments utilizing the automated invoice submission and completion • 40 FTE reallocated
Case Study 3: Data Management	• Keying in hundreds of data attributes per data object resulting in significant lead time • No coherent method to identify data consistency and quality issue requiring manual review • Lack of visibility into data accuracy across various data management applications	The **ZORA AI™ Perform** Autonomous Data Management solution augments CRUD processes, with multiple 3rd party sources, data self-healing, self-learning AI/ML models and self-generation to enrich the data during the creation process as well when data is at rest.	• Improved and efficient MDM operation cycle time up to 60% • Automated AI/ML driven data quality monitoring and enrichment through self-generation and self-healing of attributes • Efficiency of up to 70% was aimed
Case Study 4: Perform Contract Renewals	• Multiple applications such as CPQ, ERP, and CLM • Time wasted in data gathering, aligning on the renewal strategy, and finalizing the revised quote. • Limited opportunities to cross-sell / up-sell due to the rules set up in the systems	**ZORA AI™ Perform** data model applies self-learning algorithms from existing customer contracts, offer changes, pricing strategies, & service call history to generate a recommended "Smart Quote" with the right product/service and price combination.	• 30 – 40% reduction in quoting cycle times • 5 - 10% increase of total contract value • 40 – 50% reduction of CPQ maintenance • 5 – 10% reduction of churn with better customer experience and automated renewals

ADDITIONAL USE CASES

Example Use Case: Sales Pipeline Analysis

Agentic AI platforms connect to multiple data sources across the accounting and finance landscape to accomplish tasks

1 User Prompts:

"Build an analysis that describes sales pipeline health compared to the previous quarter for each of our products and services"

2 Conversational Agent:

Interprets this request as "compare volume and value of deals by stage across products and time periods," to trigger supervisory agent

3 Supervisory Agent:

Sets overall flow of operations, including task order, needed outputs, and inputs/subtasks requires to fulfill the request. Delegates tasks to functional agents

Tasks Include:

- Pulling sales and pipeline data from ERP and CRM for both quarters
- Group data by product/service and deal stage
- Generate comparative statistics
- Draft report and visualizations if needed

4 Functional Agents:

Perform domain-specific logic and computations, including:

- generating specific comparisons or analytics
- narrative report generation using company-specific language
- and including commentary on pipeline changes using CRM data

5 Utility Agents:

Performing subtasks including:

- Pulling raw data from ERP/CRM
- Formatting and early-stage calculations

Corporate Use Cases | Value

FINANCE & REVENUE MANAGEMENT

Decision Area:
Demand Forecasting

Business Objective:

Forecast menu item demand and optimize upsell/cross-sell opportunities by analyzing historical data and market trends

Example:

Use AI-based demand forecasting to analyze market trends, external data, customer traffic and preferences. This allows restaurants to predict number of customers and item demand during different times of day

Potential Value:

- Enhanced customer service
- Reduced labor costs

Decision Area:
Channel Optimization

Business Objective:

Analyze historical performance and customer behavior across different distribution channels to optimize channel mix and allocation of inventory (e.g., dine-in vs. delivery vs. take-out)

Example:

Analyze customer data and identify the most effective communication channels for reaching different customer segments. Tailor marketing strategies to each channel's strengths and audience preferences to increase engagement, build brand loyalty, and maximize ROI in its marketing efforts.

Potential Value:

- Increased sales
- Improved return on investment

FINANCE & REVENUE MANAGEMENT

Decision Area:
Financial Analysis & Report Generation

Business Objective:

Provide advanced insights and visualizations on company- or store-level revenue performance, pricing trends, demand patterns, and market dynamics and provide real time recommendations and feedback on areas of improvement

Example:

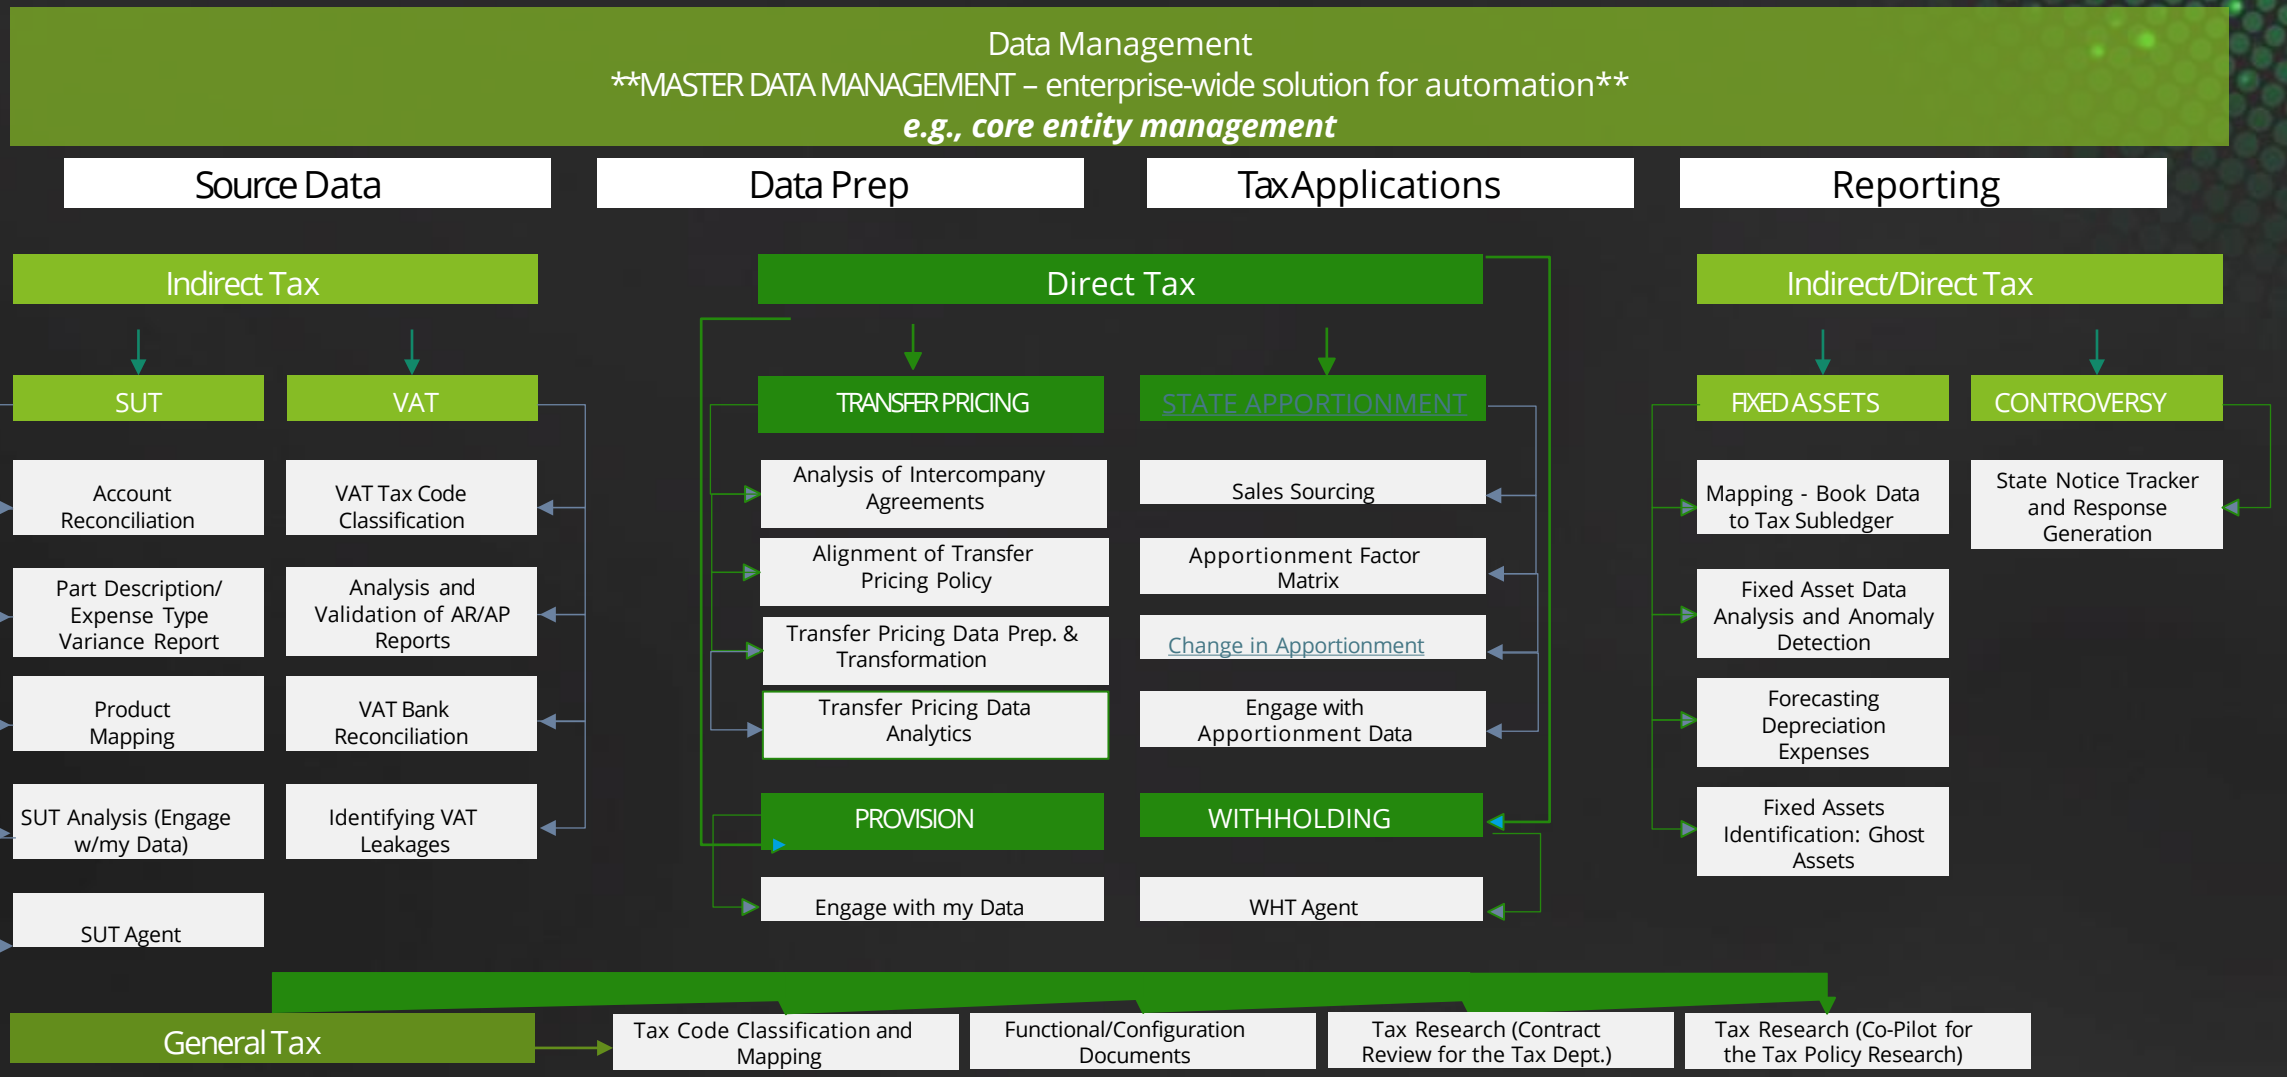

Automate the process of analyzing financial data and generating reports. This can include analyzing revenue trends, tracking expenses, and evaluating financial performance against set goals.

Potential Value:

- Increase efficiency
- Reduce errors
- Provide real-time financial health insights

Use Cases Across Tax Processes

© 2026 Deloitte Development LLC. All rights reserved.

AI Tax Agents: A Catalog of Use Cases

Sales and Use Tax Data Anomaly Agent
Sales and Use Tax Data Anomaly Agent aids AP and tax professionals by reviewing ERP invoice transactions before tax filing, identifying errors like incorrect material codes or address mismatches, and suggesting corrections. The agent streamlines corrections, enables dynamic data queries, and helps automate journal entries, enhancing efficiency and accuracy in tax compliance and providing real time insights.

Engage w/my Data
The 'Engage with My Data' AI solution queries a user's dataset (direct / indirect tax) by extracting and transforming data from the client's tax systems and workpapers. It answers data-aware questions while ensuring data security and applying logic to provide accurate and insightful responses.

Data Mapping Agent
Data Mapping Agent automatically generates tax sensitivity and tax adjustment mappings tailored to specific tax systems, leveraging entity and account data. Streamlining the process of aligning financial data with tax requirements, reducing manual effort and errors.

Tax Systems Agent
Tax Systems Agent enables a three-way reconciliation between the return, tax system and the workpaper. It also generates XML and other required filing outputs, simplifying regulatory and reporting workflows.

Invoice Scraping Agent
The Invoice Scraping Agent extracts unstructured data from invoices and converts it into structured data for further processing.

WHT Agent
The WHT Agent leverages GenAI to automate the extraction and validation of invoice data, including address verification, treaty identification, and calculation of tax amounts with real-time currency conversion. By analyzing variances between invoiced amounts and withholding tax payments, the Agent proactively flags discrepancies and compliance risks.

Notice Tracker and Response Generation
Automates the tracking, cataloging, and generates a first draft response of notices. A tax department receives notice letters from authorities for various reasons (assessments of penalty, interest tax, underpayment of tax, late filing, due date reminders, information requests etc.)

Data Prep Agent
Data Prep Agent automates the validation and reconciliation of Trial Balance and source data, flagging discrepancies, new accounts, new entities, and data anomalies. It presents actionable insights enabling users to quickly review and address issues.

Indirect Tax Code Validation & Reporting
The Indirect Tax Code Validation and Reporting solution identifies, summarizes, and quantifies the potential impact of incorrectly applied tax codes within transaction-level details. It highlights trends by Buyers, Tax Code/Jurisdiction, and Suppliers.

VAT IntelliClass Agent
VAT IntelliClass Agent assists users in accurately categorizing VAT transactions by recommending the correct tax codes, reducing manual errors and streamlining tax compliance processes.

ADDITIONAL USE CASES

Considerations for Tax

Enterprise Initiatives

Engage with enterprise-wide AI initiatives and shape solution design to meet the needs of Tax

Ecosystems & Alliance AI Solutions

Leverage the latest AI capabilities introduced by Tax software vendors

Operations Enablement

Integrate Gen AI into tax digital transformation solutions

Use cases for tax

Tax subledger data dependencies	Data/system reconciliation & certification	Document management & creation
Reporting & analytics	Monitoring & Anomaly detection	Automated data wrangling
Tax classifications	Tax engine/system maintenance & support	Tax compliance & Legislative updates

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Case 1: State Apportionment

Sales Sourcing - Determine Associated Receipt Type and Jurisdiction

PROBLEM STATEMENT

The taxpayer has difficulty with standardizing and classifying diverse transaction data due to varying state rules and complex business factors, leading to time-consuming and error-prone apportionment calculations.

OBJECTIVES

- Utilize GenAI to automate data extraction from unstructured sources
- Implement automated data mapping and scripting for apportionment updates
- Enhance data classification accuracy and adaptability
- Implement GenAI in data transformation for predictive modeling for future sales location patterns

POTENTIAL IMPACT

1. **Improved Data Consistency**
   Efficient extraction and standardization of data across board
   - Reduces manual effort required to handle varying data format

2. **Streamlined Apportionment Calculations**
   Automated classification of receipts
   - Faster and more accurate tax reporting.

3. **Reduced Manual Interventions**
   Automation of data extraction, mapping and classification
   - Promotes focus on higher value tasks, improving productivity and efficiency

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Case 2: State Apportionment

Apportionment Factor Matrix - Identify the Apportionment Factor Required / Elected and Highlight the Impact

PROBLEM STATEMENT

The taxpayer has difficulty with identifying appropriate state apportionment factors due to complex, state-specific regulations and the labor-intensive process of manually detecting anomalies in large datasets, leading to inefficiencies and potential compliance risks.

OBJECTIVES

- Leverage GenAI algorithms to automate apportionment updates in response to new data or jurisdictional modifications
- Compare different apportionment scenarios to highlight their impact on tax liabilities and compliance
- Continuously monitor and automatically identify unusual patterns and anomalies in large datasets, including apportionment calculations and flag any deviations for further review

POTENTIAL IMPACT

1. **Enhanced Data Analysis**
   Analyze updates and data to determine state apportionment factors.
   - Drives compliance with evolving state-specific laws and strategic alignment with business operations.

2. **Improved Scenario Comparison**
   Compares different apportionment scenarios, highlighting the impact of each choice.
   - Supports compliance with state specific laws and strategic alignment with business operations.

3. **Efficient Anomaly Detection**
   Automated monitoring of apportionment calculations
   - Reduces time and computational resources required for manual anomaly detection

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Case 3: State Apportionment

Apportionment Factors Change Year-over-Year by State

PROBLEM STATEMENT

The taxpayer has difficulty with evolving tax regulations, requiring continuous monitoring and adaptation. Traditional methods are resource-intensive and complex, demanding specialized expertise for calculations, anomaly detection, and data presentation.

OBJECTIVES

- Automate apportionment calculations and updates in response to jurisdictional changes
- Streamline the generation of detailed and customized reports
- Enhance anomaly detection in large datasets
- Continuously monitor and analyze legislative updates and scenario changes

POTENTIAL IMPACT

1. **Enhanced Operations**
   Increased Efficiency and Accuracy
   - GenAI scripting for apportionment calculations drives compliance and scalability, reducing the risk of penalties.

2. **Efficient Data Analysis & Reporting**
   Automated Insights and Real-Time Analytics
   - GenAI streamlines data management with automated reporting and continuous monitoring.

3. **Better Decision-Making**
   Comprehensive Analytics
   - Clear insights into trends and changes facilitate informed decision-making, leading to enhanced tax strategies and cost savings.

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Case 4: State Apportionment

Engage with Apportionment Data - Create Impactful Analytics

PROBLEM STATEMENT

The taxpayer has difficulty with interpreting complex apportionment data from multiple sources, leading to inefficiencies and underutilization of valuable insights in their tax reporting processes.

OBJECTIVES

- Automate the analysis of state apportionment data using GenAI
- Generate comprehensive reports and actionable insights through Natural Language Processing (NLP)
- Utilize predictive analytics to use historical data to forecast future trends for impactful analysis
- Implement real-time data visualization for immediate trend identification, making it easier to interpret complex apportionment data

POTENTIAL IMPACT

1. **Efficient Data Analysis and Reporting**
   Streamlines apportionment data management with automated reporting
   - Enabling early identification of irregular transactions to maintain compliance

2. **Customization**
   Allows for highly customizable analytics and reports
   - Reduces the need for extensive manual intervention

3. **Improved Decision-Making**
   Provides clear and actionable insights
   - Identifies trends and anomalies for timely and informed actions

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Use Case 5: Controversy

State Notice Tracker and Response Generation

PROBLEM STATEMENT

The organization's tax reporting suffers from delays, errors, and high costs due to reliance on a few employees, data security issues, and inefficient manual processes.

OBJECTIVES

- Utilize GenAI algorithms for automated document classification (i.e. sorting tax notices)
- Automate data extraction from various notice types to enhance accuracy and efficiency
- Integrate data into tax systems to drive consistency and reduce manual efforts
- Use advanced analytics for trend forecasting and notice pattern analysis

POTENTIAL IMPACT

1. **Enhanced Compliance and Risk Mitigation**
   Drives timely, accurate state notice responses, reducing non-compliance risk
   - Identifies potential risks early and addresses them proactively to prevent escalation

2. **Operational Efficiency**
   Consistent data integration and automated processes reduces errors and enhances overall compliance.
   - Reduces manual effort and speeds up the classification and routing of tax notices

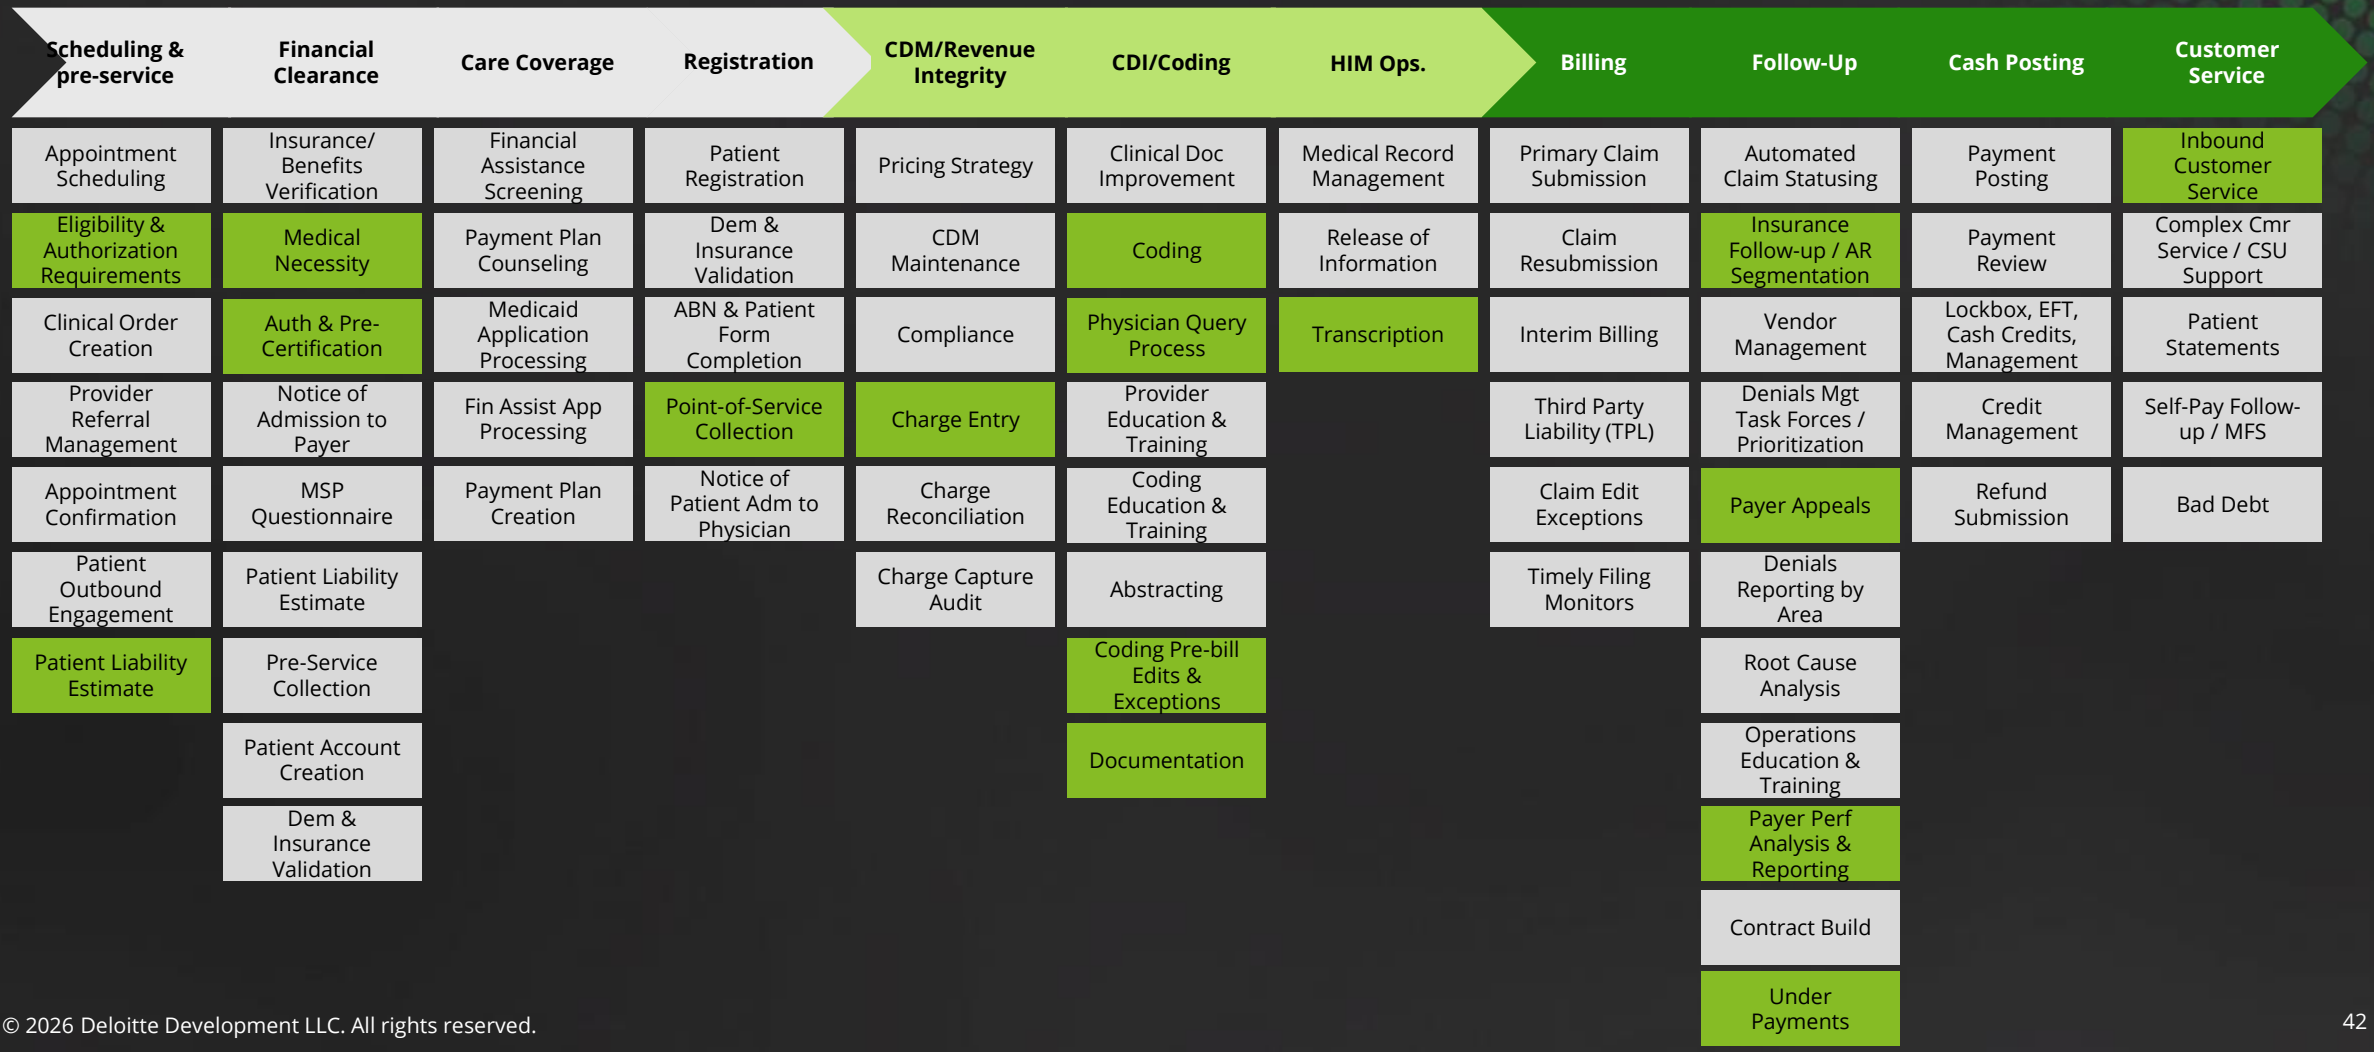

3. **Cost Savings**
   Decreases the need for manual processing, leading to significant labor cost savings
   - Early identification of issues prevents costly penalties and interest.

ADDITIONAL USE CASES

No-Regrets AI / GenAI Use Cases in Revenue Cycle

Key: No-Regrets Use Case

© 2026 Deloitte Development LLC. All rights reserved.

Use Case Deep Dive | Controllership

Functional Area ▶ **Controllership**

Key use cases:

- Automate accruals calculations from open POs
- Prepare internal/external financial reporting including flux analysis, commentary and insight generation
- Complete data entry and reconciliations
- Source-to-target COA mapping
- Intelligent contract review

Key market trends:

- **Reporting –** our clients are evaluating use cases related to financial, management, and operational reporting – in particular chatbot style GenAI tools that allow end users to conversationally interact with their data and generate reports, insights, and trend analyses

Activating Questions

1. **What are you already thinking about?**
2. **What areas of opportunity do you see for AI?**
3. **Feedback / questions?**

© 2026 Deloitte Development LLC. All rights reserved.

Use Case Deep Dive | Transactional Finance

Functional Area ▶ **Transactional Finance**

Key use cases:

- Data quality monitoring & anomaly detection
- Manage PO/invoice matching and payments
- Manage billing, collections and revenue leakage
- Shared services knowledge support
- Predictive risk modeling
- Virtual collections assistants
- Cognitive spend analysis

Key market trends:

- **Revenue Leakage** – Many of our clients are evaluating this use case to identify & proactively correct revenue leakage
- **AP** – Clients in the Tech & Media space are evaluating GenAI to identify trends in their procurement process and recommend most-optimal payment terms/timing

Activating Questions

1. **What are you already thinking about?**
2. **What areas of opportunity do you see for AI?**
3. **Feedback / questions?**

© 2026 Deloitte Development LLC. All rights reserved.

Use Case Deep Dive | FP&A / BU Finance

Functional Area ▶ **FP&A / BU Finance**

Key use cases:

- Variance analysis and trend identification
- Predictive planning and forecasting
- Scenario modeling
- Challenger Models
- Benchmarking analysis (e.g. SG&A, overheads, technology spend)
- Financial Data engineering

Key market trends:

- **Client Use Case:** Telco HW/SW/Services – Our FinanceAI Analyst functionality was built on our AIOPS.D platform for a telco technology & services company – includes a chatbot on top of financial data for financial analysts to get access to insights faster & conversationally

Activating Questions

1. **What are you already thinking about?**
2. **What areas of opportunity do you see for AI?**
3. **Feedback / questions?**

ADDITIONAL USE CASES

Real Finance Use Cases – Enterprise Solutions

Production

Deploying

FinanceAI Analyst / Co-Pilot for FP&A

Analyze data and produce insights on natural language queries using organization terminology / formats

IR Earnings Assistant

Generate potential questions from financial analysts to better prepare key earnings call spokespeople

Duplicative Invoice Identification

Identify potential duplicate payments and convert user queries to process insights for better vendor compliance

1

Digital Business Review

Deploy digital always on business review process leveraging AI to guide, inform, and analyze based on the users persona, role and requests

Expense Analyst (Domain)

Report, analyze and provide recommendations on domains for enhancing expense management (i.e. facilities, real estate)

AP Assistant

Enhance invoice payment process, purchase process, and master data insights

Contract Lifecycle Management

Ensure key financial terms on contracts to improve hygiene and compliance

3

Anomaly Detection & Commentary Automation

Automate transaction anomaly detection and automate text generation for fraud reports

2

Digital Project Controller

Deploy digital assistant to enable financial project mgmt. such as pricing, forecasting, and budget vs. actual variance analysis

Collections Automation

Captures customer payment remittance data from PDFs to update AR records and automatically create the cash forecasting view.

Patterns

Insight Production

Process Automation

Talk to my data

ADDITIONAL USE CASES

Potential Generative AI use cases in finance

Representative set of Gen AI/AI use cases

Management Reporting Variance Analysis & Insights

Produce management reports & first-level variance analysis on demand in any medium including insights and commentary.

FinanceAI Digital Analyst

Perform end-to-end automated analytical process to provide complete analysis and insights on demand from multiple financial sources.

Planning & Forecasting

Automate the generation of predictive budgets and forecasts with natural-language based updates to assumptions and scenarios.

Record to Report Close Optimization

Automate Record to Report processes using GenAI, reducing human adjudication to increase accuracy, standardization, and timeliness.

Shared Services Intake & Automation

Provide a new conversational AI (chatbot) interaction layer where employees can request any services based on free-form request and automate resolution leveraging AI models.

Collection Automation

Facilitate payment collection through GenAI- enabled “virtual assistant” to identify collections gaps and automate outreach and processing.

Intelligent Contract Review

Intelligent contract drafting, management (e.g., rapid retrieval, summarization, and monitoring), and review (e.g., rapid identification of lease types, patterns, outliers).

Sales Order Processing

Combine GenAI with optical character recognition to fully automate the creation of sales orders; focus customer service on managing exceptions.

Financial Data Engineering

Ingest, remediate, enhance, and prepare operational, financial and 3rd party data for downstream applications with automated data quality checks with AI tools.

Illustrative list, not exhaustive

Report-specific AI use case: Intelligent Statement of Cash Flows Preparation

Client problem & traditional approach

Preparation of Statement of Cash Flows is a quarterly reporting and/or regulatory requirement for all public clients. The process to extract, prepare, and generate SEC reports and financial statements can be manually intensive.

Manual Preparation Financial data is prepared and synthesized in Excel by multiple users before pasting into Workiva

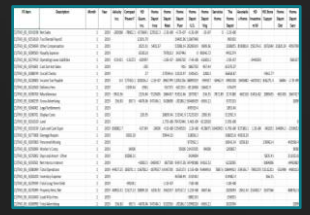

Limited Linking Workiva workbooks owned by individual account teams resulting in manual updates

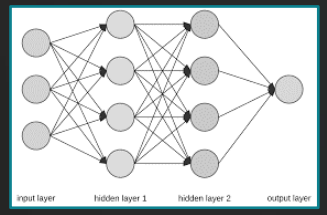

Manual Extraction Manual extraction of financial data from SAP S/4HANA and other systems

Prone to Error Manual movement of data increases the likelihood of inaccuracies in financial reporting

How does AI unlock the desired future state?

An AI-based solution **to accelerate teams' ability to transform trial balance data into an organized, classified Statement of Cash Flows** output based on IFRS or U.S. GAAP requirements.

YTD Cash Flow Worksheet (in thousands) - US Companies								
P12	12							
		February 2, 2020	Cash	AR, net	Merch inventories	Other Curr assets	PP&E, Net	Right of Use Asset
		January 31, 2021	489,051	1,864,516	13,053,389	1,080,033,268	20,302,092	5,169,473

Cash Flows from Operating Activities:			5,678,401	433,200	1,339,802	(16,652)	1,526,368	117,759
Net earnings	NetE	12,216,740						
Reconciliation of net earnings to net cash provided by operating activities:								
Depreciation and amortization	D&A	2,283,826					2,204,310	
Operating Lease Amortization	Oops	(10,802)						776,152
Operating Lease Other	Oops	(2,140)						(2,157)
Stock-based compensation expense	SBC	307,380						

Value & potential outcomes

Quicker Time-to-Impact
AI unlocks reduced time of statement preparation and completion

Enhanced Consistency
Application of GAAP and IFRS for Line-Item Generation enables consistency in reporting

Operational Efficiency
AI-enabled Statement of Cash Flows preparation liberates hours that would have previously been allocated to manual preparation.

The AI Dossier – Highlights

Energy, Resources, and Industrials	Financial Services and Insurance	Government and Public Services	Tech, Media, and Telecom	Life Sciences and Healthcare	Consumer
Predictive Machine Maintenance Use AI to optimize industrial machine performance, predict failures, and inform maintenance requirements with IoT-powered asset monitoring	**Banking Fraud Analytics** Use AI and machine learning to detect transactional and account takeover fraud across the banking value chain	**Claims Processing Back Office Automation** Use robotic process automation (RPA), natural language processing (NLP), and computer vision to digitize paper documents and accelerate processing	**Smart Factory and Digital Supply Network** Use AI to optimize the contract manufacturing process through micro services, and to accelerate demand planning, improve demand signals, and tightly integrate cross-functional supply chain processes	**Digital Data Flow for Clinical Trials** Use cognitive automation to integrate trial data from multiple systems, populate standardized digital data elements, and generate trial artifacts such as case report forms and study reports	**Fleet Network Optimization** Use AI and machine learning to create optimized network plans for ground and air fleets—maximizing efficiencies within and across business lines.
Edge AI for Production and Planning Use IoT solutions based on Edge AI to streamline production and planning processes—and to reduce unexpected downtime	**Conversational AI** Use conversational AI solutions such as chatbots and virtual assistants to handle a wide range of consumer-facing activities—from helping consumers find a better credit card or cancel unneeded accounts, to negotiating collections	**Population Risk Support** Use AI and human-machine teaming to better predict risk for housing and food insecurity, addictions, and mental health episodes— enhancing public policy to improve citizens' quality of life	**Direct Consumer Engagement** Use AI to automate engagement and communication with customers, predict customer behaviors and next best actions, and increase personalization	**Drug Manufacturing Intelligence** Use algorithmic models and sensor data to maximize factory yield and productivity by predicting manufacturing deviations and pro-actively suggesting corrective actions	**Connected Customer** Personalize and improve the customer experience through consolidated platforms that harness the power of AI, machine learning, and natural language processing
Field Sensor Data Analysis Use AI technologies to analyze real-time data from networks of sensors in the field (combined with scientific knowledge models and information about various environmental/peripheral factors)	**360° Customer Experience** Use AI to acquire customers and deliver an ultra-personalized, end-to-end customer experience supported by deep AI-driven insights, including customer churn prediction/ prevention, estimated customer lifetime value (CLV), marketing optimization, customer segmentation and personalization, and next best action	**Biomedical Data Science** Use AI algorithms to analyze large quantities of biomedical data—including genomic, imaging, and clinical data—to accelerate discovery of new ways to prevent, diagnose, and treat diseases	**Digital Contact Center** Use AI technologies such as natural language processing and machine learning to build Voice Virtual Assistants that are more efficient, engaging, and human-like	**Drug Marketing Omnichannel Engagement** Use machine learning models to predict the best ways to engage with patients and health care professionals (HCPs)—and to optimize marketing spend across media channels	**Items Assortment Planning Optimization** Use AI to determine which items should be stocked or substituted to optimize sales, margins, inventory, and customer satisfaction
Field Workforce Support and Safety Use AI technologies such as natural language processing (NLP) to give field workers easy access to critical information. Also, use computer vision and machine learning algorithms to sense dangerous working conditions and automatically generate alerts.	**Insurance Underwriting** Use AI and machine learning to help enhance underwriting processes and risk evaluation, aid in decreasing decision times, and possibly improving the customer experience and bind rates	**Benefits Administration** Use AI to optimize service recommendations and enhance customer engagement, improving both the speed and quality of service delivery while transforming the employee work experience and reducing workloads	**Detect Fake Media Content** Use advanced AI technologies to detect 'deepfakes' and fake media content by identifying subtle content anomalies	**Voice of the Patient Insight** Use AI to analyze patients' and HCPs' social media feedback, complaints, and adverse events—generating insights that can improve product design, packaging, and educational materials.	**Consumer Demand Planning, Forecasting, and Marketing** Use AI to augment marketing and improve demand planning and forecasting
Predictive Insights for Utility Service Outages Use AI algorithms and predictive analytics to forecast energy loads and peaks in demand— reducing service outages, and providing customers with more accurate timing and duration estimates for outages that cannot be avoided	**Trade Operations Automation** Use AI and machine learning to help automate tasks such as trade reconciliation and operational exceptions remediation	**Health and Environmental Predictions** Use AI to identify patterns, impacts, and mitigation options for challenges related to public health and climate change	**Customer Data Monetization** Use AI to extract and monetize insights from the vast amounts of customer data now being generated by digital systems	**Proactive Risk and Compliance** Use AI to automate the analysis and aggregation of data when identifying risk and compliance issues—recommending the next best action and possible mitigation methods	**Digital Contact Center** Use AI technologies such as natural language processing and machine learning to improve the contact center experience and overall customer satisfaction

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI Use Cases Across Financial Services

Use Case Type	Banking	Capital Markets	Wealth/Investment Mgmt.	Corporate Function
Document Extraction	OCR and LLM based **extraction for several types of docs** : Mortgage, Commercial Loans, syndicated loans etc.	**Extract information from contracts**, M&A documents, prospectus, market research reports for further processing	Wealth managers can extract important information from **account statements** such as balances, transactions, fees, and investment performance.	**Extraction of competitor information** from public sources for corporate bench marking for HR, Facilities, etc.
Query and Search	**Find contracts that have a covenant where** and addition amount more than $1 Million is not allowed to be borrowed without Bank review.	For which of **credit agreements is the interest rate derived** based on LIBOR base rate. (eg: plus 2%). Text can be plus x% or other varying forms	Based on **Terms and Condition** section, Find me all contracts where the "*at time of disbursement, spousal consent is required*"	Deep **search of Vendor contracts**: find me all contracts where a 2% discount was given for inflation adjustment
Cluster and Classify	Classify transactional, customer profiles, legal documents for each customer based on **risk profiles**.	Cluster and then Classify various **Trade Compliance and Error Reporting errors** for investigations and handling	Classify **customer communication emails** and voice calls into various categories for Routing, Premier Handling, segmentation etc.	Classify **helpdesk tickets, customer complaints**, etc. into various categories to drive experience and productivity improvement
Summarize and Q&A	Create an **executive summary for a Chief Risk Officer** for of a Commercial Loan document summarizing the changes in credit facility for a syndicated loan	Based on **10K and 10Q filings can you create an executive summary** of risk themes and how they have changed in last 5 years for GOOG	Build a **comparative rater** comparing various Institutional plans based on publicly available competitor information	Create a **CFO executive summary** and monthly update for the monthly financial report
Generate and Rewrite	Co-create a **new loan agreement** based leveraging language from similar loan documents for a particular industry segment	Create a draft copy of a **customer email summarizing recent changes** in management structure for a company based on 10K	Create an "English" based **advisor dashboard** the creates the SQL/Python to drill further and slice ad dice specific datasets	Create **de-biased and inclusive job postings** to not only attract right talent but also avoid regulatory issues

ADDITIONAL USE CASES

Overview of Top Treasury AI Use Cases

In Development through Zora

1. **Autonomous Cash App:** enhance AR processes by implementing robust data extraction, remittance handling, business rules application, cash application and matching, reporting functionalities

Additional Top Use Cases

2. **Payments Monitoring:** agent monitors payment activity, identifies required actions for payment resolution, and provides scenario reporting
3. **Transaction Mapping:** agent determines the purpose of transactions and classifies them
4. **Bank Statement Monitoring:** agent monitors daily bank statement receipt and actions any required reconciliations
5. **Cash Forecasting:** agent monitors forecasting activity and alerts on variances in inputs
6. **Cash Positioning:** agent integrates short-term forecasting inputs into cash positioning process to provide more accurate funding decisions

ADDITIONAL USE CASES

Re-Imagining the Treasury Function with AI

Treasury can be reimagined such that replaces manual processes with end-to-end automation, real-time oversight, and integrated systems.

Cash Management

Real-time bots aggregate balances and optimize liquidity across accounts, with human review only for unusual variances or forecast anomalies

- **Exception Maintenance Agent**: Flags and classifies anomalies, identifies a root cause & suggests possible fixes, solving where possible. Routes complex/high-risk to treasury staff
- **Liquidity Optimizer Agent**: Executes fund transfers based on pre-set rules and market conditions

Payments

AI-driven payment processing, fraud detection, and reconciliation operate autonomously, involving humans solely for flagged exceptions

- **Beneficiary Agent:** Validates bank-required information is provided based on payment type & flags missing information
- **Payment Processor Bot**: Executes payment runs and approvals
- **Fraud Detection Agent**: Monitors transactions for risk indicators

Banking

Digital agents automate bank account management and compliance checks, escalating only complex relationship or regulatory issues to staff

- **Bank Account Lifecycle Agent**: Manages account creation, maintenance, and closure
- **Bank Relationship Agent**: Monitors bank performance and fee structures
- **Compliance Checker Bot**: Verifies KYC/AML and regulatory documentation

Risk Management

Continuous AI monitoring and automated hedging manage financial risks, requiring human input only for outlier scenarios or strategy adjustments

- **Risk Monitor Agent**: Aggregates exposures (FX, interest rate, credit) and triggers hedges
- **Hedging Execution Bot**: Executes trades based on pre-set strategies
- **Scenario Analysis Bot**: Runs simulations and escalates exceptions

Debt & Investments

Bots and AI automate servicing, optimization, and monitoring—alerting staff only for exceptions or issues needing intervention

- **Debt Settlement Bot**: Automatically schedules, validates, and executes debt payments while reconciling transactions
- **Short-Term Instrument Execution Bot**: Identifies investment opportunities, executes buy/sell orders for short-term instruments

Anticipated Benefits*

- *Reduction of **2-4 hours** per day per CM resource*
- *Ability to attain **95+% cash visibility** prior to human intervention*
- *Reduction of long-term forecasting error rates of **10-15%***

- ***70-90%** reduction in time spent analyzing payment errors*
- *Increase rates fraud detection to **90-95%,** from a traditional fraud engine of 60-80%*

- ***100%** automation of bank statement receipt to exception handling*
- ***30-50%** improved faster bank onboarding*
- ***80-90%** reduction in time spent consolidating account data for FBAR filings*

- *Up to **70%** reduction of manual intervention from initiation to settlement*
- ***95%** automated exposure identification for liquid currencies*

- *Up to **95%** reduction in manual intervention for routine debt settlements*
- ***60-85%** reduction in debt settlement cycle time*
- ***90-98%** straight through processing rate for investment trades*

*Actual results will depend on baseline process maturity, data quality, and AI solution fit
Change management and training are critical to realizing full benefits.

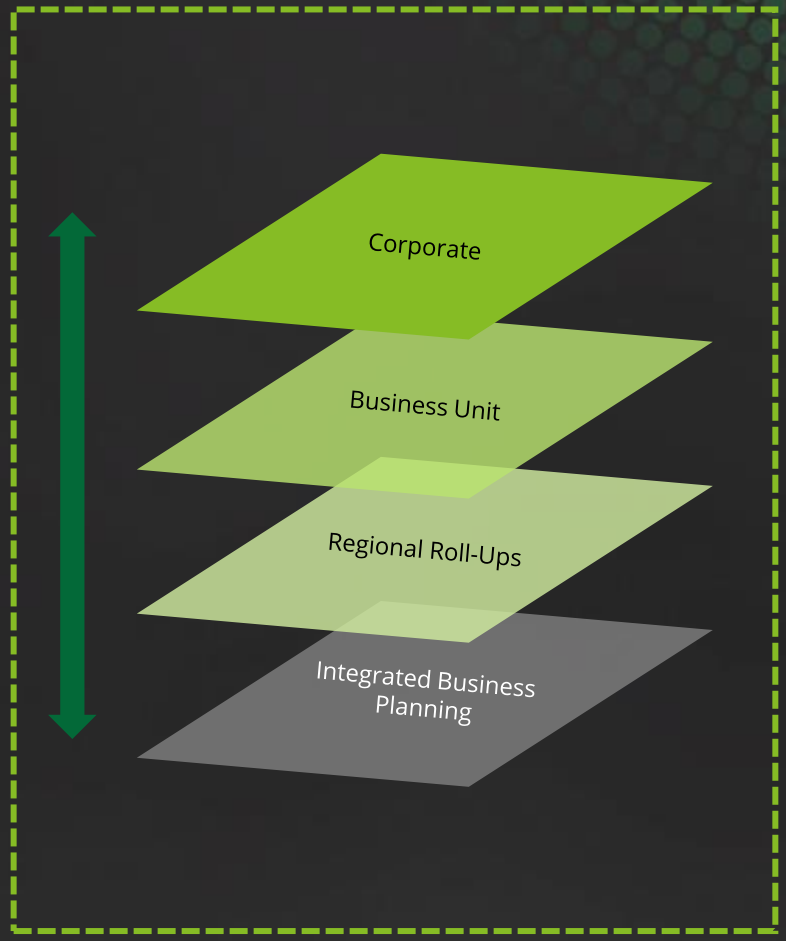

Applications Across Finance with Varied Use-Cases

Typical applications of PrecisionViewTM cover a defined use-case and level of planning to support financial and operational planning, budgeting, and forecasting objectives

Common Use Cases

Levels of Planning

ADDITIONAL USE CASES

We've created a method to show GenAI's effects on the organizational value chain and specific use cases within them

Our Approach

Our Research

We have used…

- Improvement in efficiency and productivity
- Reduction in costs
- Increase in innovation and growth
- …

*… **benchmarks** to determine an overall value realization of…*

- Revenue Growth
- Operating Margin
- Asset Efficiency
- Effectiveness

*… per **shareholder value driver** and curated high-impact **use cases across**…*

- Financial Services
- Energy, Resources, & Industrials
- Life Sciences & Health Care
- Consumer
- Technology, Media & Telecommunications
- Government & Public Services

*… **industries** that give out-sized returns*

This approach empowers organizations to prioritize investments in AI, streamline their initiatives, and ultimately drive significant cost savings and operational improvements across their enterprise

ADDITIONAL USE CASES

There are different reasons for why CFOs are pursuing AI/Gen AI for their Finance orgs

Efficiency Gains

Drive greater operational efficiency to get more done with less.

Use AI/Gen AI to:

- ☑ Standardize processes and drive consistency
- ☑ Streamline workflows
- ☑ Automate activities
- ☑ Optimize the operating model

Impacts

- Cost and Size of Finance
- SLAs
- Governance

Capability Development

Develop and enhance how Finance serves the business.

Use AI/Gen AI to:

- ☑ Augment finance skills
- ☑ Expand ways to support the business
- ☑ Generate better insights from existing data
- ☑ Improve decision-making

Impacts

- Business Growth
- Business Agility
- Revenue, Expenses, Profitability

Client and Employee Experience

Offer better employee experience and improve the ways of working.

Use AI/Gen AI to:

- ☑ Personalize work-related content
- ☑ Offer new tools to amplify creativity
- ☑ Increase and improve engagement
- ☑ Enhance quality and work product outcomes

Impacts

- Employee Satisfaction
- Productivity
- Workplace Differentiation

Scale / Business Growth

Drive business growth and scale by reshaping the finance value proposition

Use AI/Gen AI to:

- ☑ Automate manual processes
- ☑ Enable real-time scenario analysis
- ☑ Boost service delivery
- ☑ Improved and fast decision-making

Impacts

- Business growth
- Create scale
- Enhanced customer experience

Governance/Risk Management

Identify, analyze, assess, monitor and mitigate the risks

Use AI/Gen AI to:

- ☑ Enable enhanced insights
- ☑ Improves accuracy and reliability
- ☑ Automate monitoring
- ☑ Streamline reporting process

Impacts

- Cost optimization
- Saves time significantly
- Compliance with Ethics

© 2026 Deloitte Development LLC. All righ

ADDITIONAL USE CASES

Representative set of AI and traditional AI use cases across the Finance domain

1. STRATEGIC FINANCE

- Assess corp. development deals and run due diligence
- Identify opportunities for capital optimization
- Perform risk assessments & advanced scenario modeling

2. FINANCIAL PLANNING & ANALYSIS

- Financial forecasting for Income Statement, Balance Sheet, & Cash Flow
- Automate creation of data visuals & presentations
- Enhance management reporting with automated insights & commentary
- Data enrichment & automated quality assurance

3. BUSINESS UNIT FINANCE

- Perform R&D budgeting, forecasting & analysis
- Manage gross-to-net forecasting & analysis
- Predict product / service demand and forecast costs
- Monitor and adjust prices to maximize profitability
- Conduct defect resolution across tools/platforms

4. TRANSACTIONAL FINANCE

- Streamline and automate payment processes for customers (P2P)
- Customer and supplier risk modeling and mitigation
- Empower touchless financial close (R2R)
- Enable virtual collections assistants (O2C)

5. CONTROLLERSHIP

- Systemize recurring entries and reconciliations
- Perform source-to-target COA mapping
- Analyze contract terms for accounting impact
- Generate internal and external financial reports with commentary & insights

6. INTERNAL AUDIT

- Produce walk-through transcripts or documents and generate process flow diagrams (SOX Assistant)
- Using AI based Controls Meeting Assistant which can identify key information such as discussion agenda, key participants, follow up questions and can also collate action items in a client meeting

7. TREASURY

- Automate cash forecasting and management for improved cash flow visibility
- Predict & analyze currency trading, hedging, and risk
- Optimize investment mix for liquidity needs

8. TAX

- Automate tax filing and improve compliance efficiency
- Analyze tax laws and regulations using machine learning
- Mitigate compliance risk and financial impact

9. INVESTOR RELATIONS

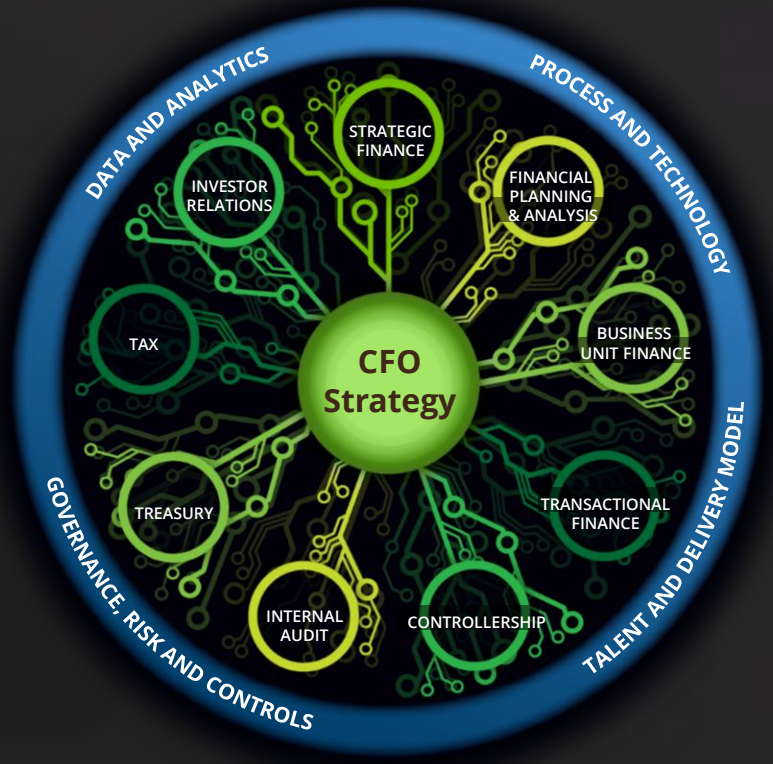

- Analyze financial data for company valuations
- Interpret complex regulations to avoid legal and financial risks
- Automate financial statement generation for external publication

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

FinanceAI

Generative AI can amplify finance capabilities to enable CFO Strategy. F&P has identified several leading practice use cases that address key agenda items and complex challenges CFOs face today.

Dynamic Finance

Management Reporting
Produce management reporting & analysis on demand in any medium including insights and commentary

Forecasting & Scenario Modeling
Provide end users with on demand forecasting and scenario modeling functionality with complete parameters and drivers flexibility

Journal Entry Automation
Automated proposed JEs are drafted and reviewed with applicable stakeholders in real-time, with limited resource follow-ups, and automated summarized documentation

Global Business Services

Virtual Collections Assistants
Leverage NLP/NLU in voice and chat channels to automate customer payment and collections activities through virtual agents

Shared Services Interaction Layer
Provide a new conversational AI (chatbot) interaction layer where employees can request any services based on free-form request

Strategic Finance

FinanceAI Insights Platform
Perform analysis & investigation, and provide 1st order insights on demand from multiple financial sources

Investor Relations Analyst Augmentation
Automate, accelerate and generate 1st version artifacts for earnings and investors (e.g., Earnings transcript, Q&A prep, articles, 10K/10Q)

Automated Data Visuals
Automate generation of visuals, graphics, and presentations to “tell the story” behind financial outcomes

© 2026 Deloitte Development LLC. All rights reserved.

INTERNAL USE ONLY

ADDITIONAL USE CASES

Transformative Applications of AI in Strategic Finance

Strategic Integration: AI's Role Across the Strategic Finance Life Cycle – Examples

Foundation & Vision	Strategy Development	Deal Execution	Transformation Delivery	Monitoring & Optimization
Enterprise value thesis	Capital budget development	Deal assessment & valuation	Program launch & governance	Capital portfolio monitoring
Finance vision development	Project prioritization	Deal negotiation	Transformation execution	Finance vision evaluation
Finance strategy creation	Corporate development strategy	Due diligence execution	Stakeholder management	Working capital optimization
Capital allocation targeting	Opportunity identification	Financial structuring	Integration support	Program optimization
Evaluation criteria setting	Working capital strategy	Transaction completion	Initiative coordination	Strategic adjustment
	Transformation roadmap	Working capital analysis	Benefit realization	Continuous improvement
		Transfer pricing management		

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Financial Planning & Analysis (FP&A)

Strategic Integration: AI's Role Across the FP&A Life Cycle – Examples

Strategic Planning	Budgeting & Forecasting	Performance Monitoring	Business Insights	Business Case Evaluation
Strategic long-range plan review	Process design & setup	Enterprise performance framework	Strategy alignment	Business case structure
Financial planning process setup	Annual & rolling calendar management	Reporting process design	Performance evaluation	Evaluation process design
Financial plan guidance	KPI target setting	Planning data governance	Insight communication	Financial model development
Plan finalization	Guidance communication	KPI framework design	Decision analysis	Investment assessment
Business alignment	Input consolidation	Performance measurement	Business recommendations	Decision support
	Variance analysis & insights	Root cause analysis		
	Risk assessment & scenario planning	Business advisory		
	Business review process	Process enhancement		
	Process optimization			

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Business Unit (BU) Finance

Strategic Integration: AI's Role Across the BU Finance Life Cycle – Examples

Strategic & Market Assessment	Target Setting & Planning	Operational Execution	Performance Measurement	Analysis & Advisory
Long-range plan review	KPI target establishment	Product costing execution	R&D performance measurement	Root cause analysis
Capital budget analysis	R&D stage gate setup	R&D project tracking	Sales performance monitoring	Variance analysis
External landscape evaluation	Sales target setting	Sales performance tracking	Manufacturing KPI tracking	Business recommendations
Market research synthesis	Pricing strategy development	Manufacturing cost processing	Pricing effectiveness review	Stakeholder recommendations
Build vs. buy analysis	Budget planning & allocation	Dynamic pricing optimization	Budget vs. actual monitoring	Process improvement
	Demand & cost forecasting	Customer profitability tracking		Strategic decision support
		Transfer pricing management		

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Transactional Finance

Strategic Integration: AI's Role Across the Transaction Life Cycle – Examples

Procure-to-Pay

- Supplier discovery & sourcing
- Procurement execution
- Receipt verification & matching
- Invoice processing
- Expense management
- Payment execution

Order-to-Cash

- Quote & sale management
- Credit risk management
- Order & fulfillment
- Billing management
- Payment processing
- Collections management
- Dispute resolution

Asset Management

- AUC/CIP settlement
- Asset capitalization
- Asset lifecycle management
- Depreciation & impairment
- Asset reconciliation
- Lease management

Project Accounting

- Project planning & budgeting
- Project accounting
- Project reporting & analysis
- Process optimization

Subledger Close

- AP subledger close
- AR subledger close
- Fixed assets subledger close
- Inventory subledger close
- Industry-specific subledger close

Operational Reporting

- KPI definition & setup
- Process design & details
- Operational reporting execution
- Variance analysis
- Business review & communication
- Process evaluation & improvement

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Controllership

Strategic Integration: AI's Role Across the Controllership Life Cycle – Examples

Close Readiness	Subledger Processing	General Ledger Close	Consolidation	Financial Reporting	Analysis & Review
Close calendar management	Close AP	Accrual processing	Intercompany eliminations	Balance sheet preparation	Variance analysis
Disclosure planning	Close AR	Deferral processing	Group statement assembly	Income statement creation	Profitability reporting
Internal controls setup	Fixed assets processing	Provision calculations	Consolidated cash flow	Cash flow statement	Budget support
Policy documentation	Inventory valuation	Foreign exchange revaluation	Investment accounting	Supporting schedules	Strategic business support
	Industry-specific processing	Trial balance review		Notes and disclosures	
		Account reconciliation		Management reporting	
		General ledger close			

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Internal Audit

Strategic Integration: AI's Role Across the Audit Life Cycle – Examples

Risk assessment	Plan development	Engagement planning	Execution	Reporting
Audit research	Broad research before planning	Audit research in planning	Data analysis	Initial draft report
Audit universe creation	Audits against risk universe	Control objectives and tests	Suggested interview questions	Draft report QA
	Suggested scheduling and allocation	Data sources and analytics tests	Assessment of risk and controls	Editorial QA
	Announcement letter	Scripts for extraction and execution	Draft of workpaper	Summation of reports
		Drafting terms of reference	Themes from interviews	Video/audio reporting
			Summation of audit evidence	Stakeholder communications
			Initial workpaper review and QA	Language translation
			Draft of observations	Communicate report

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of GenAI in Internal Audit

Strategic Integration: GenAI's Role Across the Audit Life Cycle

Risk assessment	Plan development	Engagement planning	Execution	Reporting
• Supporting auditor research and understanding of risk for a specific industry. • Supporting audit universe creation e.g. guidance on universe design and process universe.	• Supporting auditor research and understanding of risk, business processes and expected controls in advance of engagement planning. • Suggested audits against the risk assessed audit universe. • Suggested scheduling and resource allocation based on known constraints e.g. number of staff, their skills and seniority.	• Supporting auditor research and understanding of risk and business processes in advance of planning. • Suggested control objectives and test procedures based on in-scope risk areas. • Suggested data sources and potential analytics tests. • Generated scripts for data extraction and analytics execution. • First draft of scope / terms of reference.	• Analysis of data through natural language questioning. • Suggested interview questions for different stakeholders' personas. • Critical assessment of risk and control descriptions (e.g. if it covers who, what, where and when). • Initial draft of workpaper. • Drawing themes from interview notes / audio. • Summation / interrogation of audit evidence documents. • Initial workpaper review and QA. • Initial draft of issue / observations.	• Initial draft report. • Initial draft report review and QA. • Editorial QA e.g. simplifying language, sentiment analysis. • Summation of reports for audit committee summaries. • Generation of video / audio reporting. • Customised stakeholders' communications. • Report language translation. • Drafting emails to communicate the audit report.

ADDITIONAL USE CASES

Transformative Applications of AI in Treasury

Strategic Integration: AI's Role Across the Treasury Life Cycle – Examples

Treasury Operations	Financial Risk Management	Debt & Capital Markets	Investment Management	Reporting & Analytics
Cash management & forecasting	FX position reporting	Capital structure management	Investment objective execution	Liquidity position reporting
Bank account administration	Counterparty risk analysis	Debt issuance & management	Liquidity vs. return optimization	Management reporting
Intercompany management	Trading P&L management	Bank relationship management	Portfolio mix management	Regulatory reporting
Settlement processing	Risk policy enforcement	Equity management decisions	Investment return assessment	Decision-making analytics
Wire payment execution	Treasury risk identification	Credit facility management	Opportunity cost analysis	Performance monitoring
	Risk committee reporting	Credit rating relationships		

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Tax

Strategic Integration: AI's Role Across the Tax Life Cycle – Examples

Planning & Strategy	Accounting & Provision	Compliance	Technology Advisory	Tax Advisory & Support
Tax planning & legislative review	Tax provision forecasting	US federal income tax compliance	Tax technology solutions	Tax advisory support
Global supply chain structuring	Tax data gathering & review	State income tax compliance	Tax master data management	Transaction & integration services
Global trade & custom services	Tax data consolidation	US foreign operations reporting	Tax calculation management	M&A & due diligence support
Legal business services	Deferred tax preparation	Non-US income tax compliance	Tax reporting development	Accounting methods review
Credits & incentives planning	Non-US tax provisions	Transfer pricing activities	Business technology consultation	Income tax audit support
Global trade & custom services	Statutory accounting	Sales & use tax compliance		Indirect tax audit support
Global mobility planning		Digital services tax compliance		
		VAT/GST & other indirect taxes filing		

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Transformative Applications of AI in Investor Relations (IR)

Strategic Integration: AI's Role Across the IR Life Cycle – Examples

Capital Market Research & Analysis	Strategy Development	Execution & Engagement	Regulatory & Governance	Reporting
Business portfolio performance review	IR strategy development	Investor engagement execution	Compliance policy development	Capital markets trend monitoring
Company valuation	Investment thesis development	Analyst & media engagement	Control framework development	Market feedback analysis
Financial planning & management	Strategic business planning support	Capital financing execution	ESG approach development	Shareholder value communication
Disclosure rules understanding	Disclosure policy creation			Ongoing market communication

AI-powered Finance Operate value chain

Harnessing the power of Deloitte's Gen AI and Agentic AI assets and GPs to fuel the FO value chain and deliver measurable outcomes for CFOs

Domain	Financial planning and analysis (FP&A)	Business unit (BU) finance	Finance operations[1]	Controllership[2]	Internal controls & internal audit	Treasury	Tax	Investor relations
	Increase efficiency of planning/ forecasting to fuel decision-making and unlock strategic capacity	Engage specialized finance experience in optimizing pricing, R&D, sales and supply chain	Reinvent and automate operational processes –OTC, P2P, and more	Streamline technical accounting to accelerate closing cycles, and enhance external reporting to boost compliance	Augment assessment of internal controls and review of enterprise risk and compliance	Optimize cash management to reinforce compliance and reduce risk	Drive greater value through tax, while maintaining quality and transparency	Build stakeholder trust through transparent investor communication and engagement
Processes	Performance management reporting	R&D finance	Invoice-to-pay ★	Accounting Policy	Governance and risk management	Treasury operations	Tax accounting and provision	Capital markets financing and valuation
	Long-range strategic planning	Commercial sales finance	Bill-to-cash ★	Close	Internal controls	Financial risk management	Direct tax compliance	Regulatory and governance
	Budgeting and forecasting	Manufacturing and supply chain finance	Capital asset management	Consolidation	Internal audit ★	Debt and capital markets	Indirect tax compliance	IR planning and strategy
	Business case evaluation	Pricing		External financial reporting	Regulatory compliance ★	Investments	Tax advisory	
	Insights and decision support	Actuarial		Integrated reporting	Third party risk management	Insurance	Transfer Pricing	
	Variance Analysis	Securitisation		Transaction Recording				
	Cashflow Analysis							

Legend (to cases referenced herein):
- Gen/Agentic AI Asset
- Use case
- Growth platform
- ★ Success story

Note: Finance Strategy (or Strategic Finance) is considered out of scope for Finance Operate.
Note: The Finance Operate value chain is current as of October 2025; Growth Platform capabilities are illustrative and subject to further development.
Note 1. Finance Operations also be referred to as Transactional Finance.
Note 2. Controllership includes Technical Accounting and Statutory and Regulatory Reporting. Finance domain definitions and process classifications may vary by client.

Internal Controls Specific Use Cases / Opportunities

Controls vary in terms of their complexity and readiness for digitization and automation. Depending on data availability, data structure, required judgement, source systems, and degree of centralization of the process, we can lever different approaches for an optimized program:

Opportunity 1: Control Transformation

- Leverage the capabilities of your existing technology investments by configuring automated controls within your platforms
- Modify control activity procedures so they create structured data that enable automated testing and monitoring.

Opportunity 2: Automate testing of a sample selection

- Use of scripting and RPA technologies to extract data, draw a sample, and automate testing of a control or a subset of a control test.
- Testing is done on a sample basis when manual intervention is still required; for example, the bot can extract the relevant support and place it in one location for a manual tester to review and conclude.

Opportunity 3: Automate the testing of the full population

- Use of scripting and RPA technologies to extract data and automate testing of a control.
- Testing is done on a full population basis when rules-based criteria can be established to perform the test.

Opportunity 4: Enable ongoing monitoring with root cause analysis

- Recommended for the most important controls with the richest input datasets and highest risks associated, this involves building a visualization layer to track exceptions and provide context behind key drivers of the exceptions.

Opportunity 5: Broader Continuous Controls Monitoring

- As more control tests are automated and monitoring capabilities are established, this allows organizations to take the next step – coordinated, persona-based “command center” views of the top risks of the organization with drill down capabilities, integrating the 1st, 2nd, and 3rd lines.

AI in Finance | Artificial Intelligence Use Cases Across Finance

AI can be used to expedite processes within financial planning & analysis, strategic finance, and investor relations

1. STRATEGIC FINANCE

- Assess corp. development deals and run due diligence
- Identify opportunities for capital optimization
- Perform risk assessments & advance scenario modeling

2. FINANCIAL PLANNING & ANALYSIS

- Predict Income Statement, Balance Sheet, & Cash Flow
- Automate creation of data visuals & presentations
- Provide management reporting & commentary
- Enrich data & perform quality checks

3. BUSINESS UNIT FINANCE

- Preform R&D budgeting, forecasting & analysis
- Manage gross-to-net forecasting & analysis
- Predict product / service demand and forecast costs
- Monitor and adjust prices to maximize profitability
- Conduct defect resolution across tools/platforms

	Use Case	Description
1. Strategic Finance	**M&A Due Diligence**	Provide summary, recommendation, and risk detection tasks using M&A cleanroom data
	Capital Optimization	Model various scenarios, identify opportunities for optimizing capital allocation, and make data-driven decisions to maximize financial returns
	Advanced Scenario Modeling	Enable predictive challenger models to test various scenarios, market assumptions, and assess risk across short and long-range time horizons
2. Financial Planning & Analysis	**Predictive Planning**	Pinpoint best-fit algorithms and continuously improve the accuracy of forecasted outcomes produced by predictive planning tools
	Automated data visuals & presentations	Automate generation of visuals, graphics, and presentations to “tell the story” behind financial outcomes
	Advanced Reporting & Commentary	Generate driver impact, management reporting, and variance commentary, and enable voice-activated interactions with tools and dashboards through Natural Language Generation (NLG) and Natural Language Processing (NLP) technologies
	Data Engineering	Ingest, remediate, enhance, and prepare operational, financial, and 3rd party data for downstream applications with automated data quality checks using AI tools
3. Business Unit Finance	**Forecasting & Analysis**	Efficiently compile and consolidate financial data from diverse sources, eliminating manual data entry and reducing the risk of errors
	Demand Planning & Product Costing	Analyze customer data, supplier data, market trends, and other factors to determine demand as well as the most cost-effective and reliable suppliers for raw materials and other components
	Pricing Setting & Adjustments	Examine market trends, customer behavior, and other relevant factors to determine optimal prices, make pricing adjustments, and maximize profitability, allowing organizations to make data-driven pricing decisions and stay competitive in their respective markets
	Defect Resolution	Automate defect resolution recommendations and actions across various tools and platforms through workflow integration

© 2026 Deloitte Development LLC. All rights reserved.

AI in Finance | Artificial Intelligence Use Cases Across Finance

AI can be used to expedite processes within financial planning & analysis, strategic finance, and investor relations

7. TREASURY

- Automate cash forecasting, cash management and provide better visibility to cash flow
- Anticipate currency trading, hedging, and risk through predictive analytics
- Identify optimal mix of investments for liquidity needs

8. TAX

- Create automation in the tax filing process and improve efficiency with tax compliance
- Analyze tax laws and regulations with machine learning algorithms
- Mitigate compliance risk and financial impact

9. INVESTOR RELATIONS

- Analyze financial data to determine company valuations
- Interpret complex regulations to avoid legal and financial risks
- Streamline data process with automated financial statement generation for external publication

	Use Case	Description
7. Treasury	**Cash Management**	Enhance cash flow analysis through predictive analytics, minimizing liquidity risks, improving forecasting accuracy, and maximizing returns on cash holdings
	FX Currency Management	Optimize foreign exchange operations by evaluating foreign exchange data using predictive analytics, identifying patterns and trends to reduce financial risks
	Investment Management	Identify investment opportunities, optimize portfolio performance, and minimize risks by leveraging machine learning algorithms and predictive analytics to analyze market trends, financial data, and other relevant factors, allowing organizations to make informed investment decisions and maximize returns
8. Tax	**Tax Preparation & Reporting**	Automate tax filing processes, analyze financial data, and generate accurate tax reports with machine learning algorithms and natural language processing (NLP), reducing the risk of errors and improving overall efficiency in tax compliance
	Tax Law Application	Evaluate tax laws and regulations using natural language processing (NLP) and provide recommendations for tax planning, compliance, and risk management
	Compliance Management	Mitigate penalties and fines by analyzing financial data using predictive analytics, identifying potential compliance risks, and offering compliance strategy recommendations
9. Investor Relations	**Company Valuation**	Determine accurate company valuation by leveraging predictive analytics and analyzing financial data and other relevant factors, enabling informed decisions about investments and acquisitions
	Rules and Regulation Interpretation	Analyze and interpret complex financial regulations using natural language processing (NLP) and machine learning algorithms, enabling organizations to ensure compliance and avoid potential legal and financial risks
	Investor Communication	Generate first drafts of sections of 10-Q/10-K and scripts for earning calls by utilizing financial statement data along with prior quarterly/annual reports

© 2026 Deloitte Development LLC. All rights reserved.

Applications in Finance: Deep-Dive into Select Gen AI Applications

	FP&A		Transactional Finance		Controllership	
	Monthly Reporting	**Company Report**	**Account / Transactional Inquiries**	**Global Business Services**	**Report Reconciliation**	**Regulatory Adherence**
Current State Leading Practices	• Perform account level variance analysis • Manually review compiled budgets & forecasts • Compile narrated report for distribution	• Closely monitor regulatory requirements • Manually draft and publish the company reports • Prepare scripts for earnings calls and analyst briefs	• Customer Rep assigned to a small number of customers • Rep efficiency dependent on familiarity with customer's account • No aggregated knowledgebase for resolution	• SOP's and FAQ's are manually documented by experienced resources • Valuable resources deployed performing low value tasks	• Financial documents are manually tied out to underlying support • Financial reports are tied out internally to ensure mathematical accuracy and balancing	• Gap analysis is manually performed as a completeness check against missing disclosures • New regulations must be sorted through and applied or developed into accounting policy
Generative AI Solution	✓ Flux analysis is automatically generated summarizing drivers ✓ QBR package is generated and reviewed ✓ QBR is distributed to executive leadership	✓ Applicable regulatory changes are summarized and delivered ✓ Draft reports and briefings automatically generated	• Past incident history mined and analyzed to assist in future transactional research • Intelligent self-service chatbot to resolve customer concerns	• New SOP's generated on the fly to capture small changes in processes • Q&A chatbot to guide new employees through SOP's	• Reports are tied out automatically • Variances are identified and potential causes are explained (with drivers / root causes)	• Automated review and summarization of potential gaps in disclosures • New regulation is filtered on applicability and impact is summarized
Value Enabled	✓ Faster Close ✓ Shorter "time-to-insights" cycles ✓ Broader scope of variance analysis	✓ Less time developing drafts ✓ More comfort over regulatory compliance	✓ Decrease collection time for error-status invoices ✓ Reduce FTEs for transactional work	✓ High value resources deployed to high value tasks ✓ Reduced time to train new employees	✓ Decrease collection time for error-status invoices ✓ Reduce headcount of customer reps	✓ More comfort in disclosure completeness ✓ Ability to proactively plan for reg changes

ADDITIONAL USE CASES

Applications in Finance | Corporate Finance – GenAI in Capital Budgeting & Financial Reporting

Opportunity	Current State Leading Practices	Generative AI Solution	Marginal Benefits
Budget & Investment Planning	• Manually review compiled budgets & forecasts • Compile feedback across different verticals and summarize • Modify plan based on feedback	• Generate budget documentation and revision materials based on previous successful budgets • Finetune budget planning documentation with specific requests via text prompts automating the process with human oversight	✓ Prompt based document revisions for specific budgeting requirements ✓ Decrease time spent drafting overhead documentation for leadership review
Month End Reporting	• Account level activity is manually reviewed to understand variance drivers and generate relevant commentary • Synchronous, executive level meetings are required to discuss variances	• Generate concise, understandable explanation of cost and revenue drivers of account level variance • An interactive UI could allow natural language inquiries about the variances and reports	✓ Less time spent on aggregating data and diving into account variances ✓ Time efficiencies from fewer synchronous month end close meetings
Generate Regulatory Filings	• Semi-automated processes to generate the input figures • Manual process to aggregate financial data and elaborate to conform to regulatory filing needs	• Generate first drafts derived from previous filings, internal financial information, and filing requirements guided by workflows • Highlight potential edits influenced by filings of other companies	✓ Less time wordsmithing initial drafts ✓ Less time spent researching historical fillings ✓ Guided workflows act as a completeness check

Generate Regulatory Filings
Generate draft filings of various regulatory documentation

Generative AI can support the process of creating regulatory filings by saving time in the initial drafting stages by learning regulations, workflows, and patterns in previous documents.

Guided workflows provided a structured format to specify the type of filing to generate, the type of information to include, and the desired objective of the filing (i.e. a **proxy statement** that highlights the **equity incentive plan** and the result of the **board of director's** vote)

LLM can identify patterns in historical internal and external filings to generate first drafts, saving time otherwise spent wordsmithing to transition ideas to formatted legal documents

Summary of the filing and considerations taken generated for supplemental review by executive level.

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Predictive Risk Modeling

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	Controllership	Internal Audit
Treasury	Tax	Investor Relations

Build machine learning models to more accurately model customer/supplier risk based on historical behavior/outcomes and recommend appropriate treatment options

PREDICTIVE RISK MODELING

Predictive planning tools leverage algorithmic models to produce forecasted outcomes; machine learning layered on top of this process enables “best fit” model identification and continuous improvement of forecast accuracy

Key Capabilities:

Historical Trend Analysis:
Establish ML algorithms that can learn from historical data to identity patterns and predict future risks

Cross Program Integration:
Integrate across financial systems, such as accounting and risk management software, to collect and analyze data in a coherent system

Real-Time Feedback:
Monitor the latest data to identify emerging risks and provide early warning indicators minimizing lag time

Key Benefits:

Improved Risk Management identifying potential risks before they become issues and enabling organizations to take proactive risk mitigation steps

Enhanced Financial Performance reducing losses and improving operational efficiencies

More Informed Decision-Making providing insights into potential risks and the likelihood and impact of tasks

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Virtual Assistants

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	Controllership	**Internal Audit**
Treasury	Tax	Investor Relations

Leverage NLP/NLU in voice and chat channels to automate customer payment and collections activities through virtual agents, increasing collections and reducing the need for human contact center engagement

VIRTUAL ASSISTANTS

Virtual Assistants provide a convenient and efficient way for financial organizations to handle customer payments and collection activities, resulting in improved customer experience, increased efficiency, cost savings, and improved accuracy

Key Capabilities:

Payment Processing
Automate the payment process for customers, allowing users to make payments using natural language commands

Customer Service
Assist customers with any questions they may have regarding their accounts, payments, or collection activities

Debt Collection
Support debt collection activities, reducing the need for human interaction and improving overall efficiency

Fraud Detection
Detect fraudulent activities and assist customers in preventing fraudulent activities

Key Benefits:

Improved Customer Experience providing quick and convenient customer service

Increased Efficiency automating payment and collections activities with virtual assistants

Cost Savings reducing the need for human interaction in contact centers

Improved Accuracy reducing the risk of errors in payment and collection activities

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Cognitive Spend Analysis

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	Controllership	Internal Audit
Treasury	Tax	Investor Relations

Intelligently categorize structured and unstructured data using machine learning and optical character recognition (OCR) to identify trends in supplier/expense data

COGNITIVE SPEND ANALYSIS

Cognitive Spend Analysis is used by leading financial organizations to analyze large amounts of financial data, such as invoices, contracts, and purchase orders, to identify areas for cost saving and optimization.

Key Capabilities:

Data Collection and Integration
Collect financial data from various sources and integrate it into a centralized platform for analysis

Data Cleansing and Normalization
Clean and normalize financial data to ensure accuracy and consistency

Pattern Recognition and Anomaly Detection
Leverage AI and ML capabilities to analyze financial data and identify patterns in spending patterns

Predictive Analytics
Use predictive analytics to forecast future spending and identify areas for cost optimization

Data Visualization and Reporting
Present insights and results in an easy-to-understand format

Key Benefits:

Improved Data-Driven Insights helping finance organizations make more informed decision's

Increased Efficiency and Productivity through process automation enabling finance teams to save time and reduce manual effort

Cost Savings by identifying areas for cost optimization reducing overall spend and increase profitability

Improved Compliance helping organizations maintain compliance by ensuring that spend is in line with organizational polices and regulations

Better Decision-Making enabling finance teams to make data-driven decisions and achieve financial goals

ADDITIONAL USE CASES

Data Engineering

Strategic Finance	**FP&A**	Business Unit Finance
Transactional Finance	Controllership	Internal Audit
Treasury	Tax	Investor Relations

Data Engineering enables finance organizations to ingest, remediate, and enhance large amounts of operational, financial, and 3rd party data and prepare that data for downstream applications with automated data quality checks.

DATA ENGINEERING

Data Engineering is the process of **acquiring, cleaning, transforming, and storing** financial data so that it can be used for analysis and modeling by AI algorithms. Data Engineering is the **foundation for accurate and meaningful** data analysis and model development.

Key Capabilities:

Data Acquisition
Acquire financial data from various sources, such as public APIs, financial databases, and internal systems

Data Cleaning and Transformation
Clean, validate, and transform financial data into a consistent and standardized format easily used for analysis

Data Storage and Management
Store and manage large amounts of financial data in a secure and reliable manner

Data Access and Integration
Access financial data from multiple sources and integrate it with other systems, such as data visualization tools, machine learning algorithms, and reporting tools

Feature Engineering
Construct additional variables to your dataset to improve the ML model performance and accuracy

Key Benefits:

Improved Data Quality
enhancing the accuracy of financial data which is critical for accurate financial modeling

Increased Data Accessibility
easing the for stakeholders and AI algorithms to use financial data

Scalability enabling the processing and storage of large financial data sets

Enhanced Data Security ensuring financial data is protected and secure maintaining the integrity of financial information

Data Validation and Readiness Check improving the accuracy of insights provided by downstream tools

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Predictive Planning

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	Controllership	Internal Audit
Treasury	Tax	Investor Relations

Leading FP&A organizations leverage predictive analytics to advance their planning and forecasting capabilities while driving substantial value and efficiency to their organization

PREDICTIVE PLANNING

Predictive planning tools leverage **algorithmic models to produce forecasted outcomes**; machine learning layered on top of this process enables **"best fit" model identification and continuous improvement of forecast accuracy**

Key Capabilities:

Investor Relations / Board Credibility:
Provide better guidance externally and across the C-suite

Top-Down Target Setting:
Establish guardrails to communicate and cascade targets

M&A Pro Forma Enablement:
Rapidly scenario model transitioning business units

Challenger Models / Aggregation Analysis:
Assess quality of aggregated AOP / Forecast bottom-up

Plan / Forecast Starting Point:
Baseline for BU layering of Risks & Opportunities

Product / Costing / Specialized Forecasts:
Deep-dive models to aid in tactical operational decisions

Key Benefits:

Improved investor confidence in financial guidance, leading to more stable share prices

Reduced production waste and losses through improved mix forecasting based on consumer trends and demands

More timely identification and response to market opportunities as they arise

Improved investment efficiency through integration of investment scenario analysis in the forecasting process

Reallocation of resources to value-add analysis as a result of more streamlined forecasting processes

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Intelligent Contract Review

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	**Controllership**	Internal Audit
Treasury	Tax	Investor Relations

Leverage ML tools to identify key contract terms that impact lease accounting, enabling rapid initial review of contracts and identification of lease types, patterns and potential outliers

INTELLIGENT CONTRACT REVIEW

Leading finance organizations leverage Intelligent Contract Review to analyze legal contracts and identify key data points, clauses, and potential risks. The process utilize NLP and ML to improve contract review and management, saving time and reducing human error.

Key Capabilities:

Automated Extraction
Extract relevant data from large volumes of contracts, including financial terms and obligations

Language Processing
Leverage NLP to analyze the contents of contracts to identify key clauses and provisions

Risk Assessment
Evaluate contracts for potential risks and compliance issues

Contract Management
Provide insights into contract status, renewal dates, and obligations enabling efficient management of contracts

Cost Savings
Eliminate excess costs associated with manual labor

Key Benefits:

Increased Efficiency saving time and reducing errors associated with manual contract review

Improved Risk Management identifying potential risks and compliance issues mitigating legal or financial risks

Enhanced Decision Making due to the improved insights that enable better decision making from the top down

Ability to Scale to analyze large volumes of contracts, enabling organization of various sizes

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Investor Relations

Strategic Finance	FP&A	Business Unit Finance
Transactional Finance	Controllership	Internal Audit
Treasury	Tax	**Investor Relations**

Gather and summarizing various levels of reports and impacts to develop a baseline for the Investor Reporting and Preparation for Business Leadership

INVESTOR RELATIONS

Investor relations (IR) can be complex, and time-consuming with new challenges, expectations, and stakeholders. Combining the capability of AI and an IR team can improve the quickness and consistency of communications with investors.

Key Capabilities:

Automated Data Collection
AI can be fed relevant data to draft materials and responses within seconds

Draft Investor Reports
Automate initial creation various investor reports:

- Period over Period Results
- Earnings Releases
- Earnings Call Q&A narrative
- Business Development Summaries
- Current Event Responses (e.g., Impacts of product recalls)

Key Benefits:

Improved Speed to Execution enabled by automated data flows and first pass creation of investor reports

Enhanced Investor Reporting Reviews enabled by timely reporting based on the latest company direction & strategy

Better Consistency within narratives such as period over period changes and general business updates.

Targeted Focus on Strategy vs. developing routine drafts to kick-start the process

Gen AI Integrated Roadmap Development: Guiding Principles

Design a use case roadmap to achieve a series of quick wins that generate the highest possible business value while minimizing incremental effort, technical complexity and risk

1 BUSINESS VALUE

Qualify use cases *that are congruent with business priorities and highly desirable for customers to justify investment*

2 FEASIBILITY & RISK

To generate quick value, ***prioritize use cases*** *with low or moderate technical complexity, mature data sources, and limited business risk*

3 FOUNDATIONAL GEN AI TECHNICAL CAPABILITIES

Establish foundational capabilities to ***create a scalable platform*** *that reduces the incremental effort to deliver new use cases over time*

HOW DO WE GET THERE?

Art of Possible Ideation Lab

Brainstorm Gen AI use cases and discuss their business value in terms of desirability & viability

Prioritization Workshop

Group use cases into opportunity areas and prioritize them based on feasibility

Interviews with key Stakeholders

Understand use case complexity, data maturity, and qualitative & quantitative benefits

Added our Gen AI Domain Expertise

Assess the foundational capabilities required to execute each use case and examine commonalities

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Deloitte AI Case Study | US-based GPS Client

SITUATION

A US-based mid-sized enterprise (~150 employees) engaged with Deloitte to develop a strategic AI roadmap, address the existing AI risks, and to establish a governance framework. Deloitte supported the client with the requirements and also assisted in identifying AI use cases and recommending suitable technologies for adoption

APPROACH

The Deloitte engagement team's approach included:

- Education Sessions: Deloitte delivered multiple educational sessions on AI trends, capabilities, risks, and governance.
- AI Workshop: Facilitated a four hour long in-person workshop focused on AI capabilities, use case refinement, and Microsoft 365 Copilot, supported by pre-workshop interviews and surveys.
- Risk and Governance: Assessed the client's current state and provided recommendations to develop robust risk and governance policies.
- Technology Assessment: Conducted a comprehensive evaluation of current and future AI capabilities to inform use case relevance.
- Use Case Prioritization: Verified and prioritized AI use cases, securing stakeholder sign-off on viability, feasibility, and alignment with recommended technologies.

IMPACT

- Phase 1 marked the beginning of the client's AI adoption journey.
- Deloitte collaborated with the client to identify 18 use cases across four business functions, prioritizing approximately seven high-impact cases for Proof-of-Concept development using the Desirability, Viability, and Feasibility (DVF) scoring framework.
- The team delivered five educational sessions, including three custom demonstrations using Claude AI to showcase emerging capabilities. Deloitte also provided several policy documentation templates to support the client's future governance framework, covering topics such as Responsible AI, operational guidelines, and legal considerations.
- This phase established a strong foundation for the client's AI adoption strategy and governance framework.
- Following the success of Phase 1, Client awarded Deloitte with an extension for Phase 2 which included M365 CoPilot Rollout and Task Capture Solution enablement.

AI in Order-to-Cash | A Real-Life Example

Currently working with a client to developed ***an Agentic AI Use Case*** focused on the ability to…

> ***Capture customer payment remittance data from PDFs to update the AR records and automate the creation of the cash forecasting view. This includes the ability to predict the date for when a payment will hit client's bank account based on historical payments.***

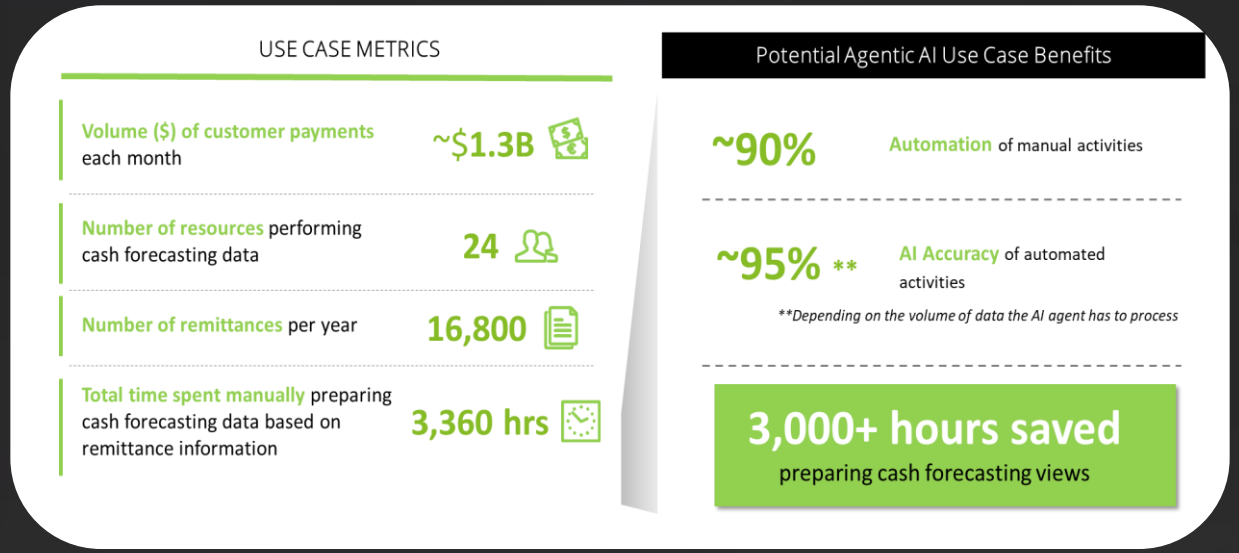

Critical Painpoints

- High volume of manual effort during month end
- Several offline files, copy/pa]ste, vlookups
- Unable to focus on RCA, trends and strategy review
- Lack of real time visibility from Treasury

AI Use Cases

- Automate remit data extract
- Analyzing historical payment information
- Forecast date when money would hit bank acct based on multiple parameters
- Dashboard providing visibility to Treasury and list of exceptions

It was based on an actual use case ***focused on collections and cash forecasting***. It has the potential ***to yield the following benefits…***

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI for Credit Management

Common Pain Points

- Lengthy customer onboarding
- Manual credit score calculations
- Missed periodic credit checks
- High number of blocked orders and manual release process

AI Use Cases

- ✓ Calculate timely and accurate customer credit scores
- ✓ Proactively monitor customer risk based on internal and external factors
- ✓ Proactively identify and prevent account suspension
- ✓ Proactively identify and prevent upcoming blocked orders

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI for Collections

Common Pain Points

- Reactive vs. proactive collections
- Manual worklist not derived from a central collections strategy
- Generic and/or manual customer communications

AI Use Cases

- ✓ Pro-active collections strategies from predicting when invoices will get paid based on client history
- ✓ Prioritized collection worklists based on customer and market behaviors
- ✓ Customized customer communications
- ✓ Automatic notes and action items/follow ups using AI/Natural Language Generation (NGL) techniques while resources are on calls with clients

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI for Collections

Common Pain Points

- Manual cash application process
- Lack of remittances
- No automatic remittance format recognition
- High bank fees

AI Use Cases

- ✓ High Percentage (greater than 90%) straight-through cash posting across all standard payment and remittance formats through AI/ML based automated data capture, invoice matching and exception handling
- ✓ Automated cash application algorithms to match payments received to open items
- ✓ For remittances with missing information, ability to provide matching suggestions to open invoices
- ✓ Ability to predict when payments will hit bank accounts based on past payment clearing behaviors

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

AI for Collections

Common Pain Points

- Manual valid/invalid deductions confirmation
- Lack of visibility in disputes/volume types
- High bad debt/ write-offs amounts

AI Use Cases

- ✓ Predictive analytics to determine validity of claims
- ✓ Suggested categorization of dispute types
- ✓ Predictive Shortage/ Price Variance Analysis and Trends
- ✓ Predictive bad debt/write-off analysis

© 2026 Deloitte Development LLC. All rights reserved.

Common use cases for Controls Testing Automation

Domain	Area	Type of Control	Automated Activities
IT CONTROLS	Logical Access	Terminations	• Compare HR termination data to network/application listing to flag employees not disabled timely • Generate automated reports to be monitored by 1st line identifying exceptions requiring action • Detail exposure through “last login date” for any individuals not terminated timely
		Access Provisioning	• Compare HR data to network/application listing to flag employees not provisioned timely • Identify employees provisioned access without proper approval in HR sourcing system
		Password and Security Settings	• Compare system configuration values to organizational standards for compliance
	Change Management	Approval of Changes/Testing Prior to Implementation	• Compare the change request approver to the authorized approver listing • Flag changes that were developed and implemented by the same individual • Identify changes that were implemented without evidence of testing (UAT or unit testing)
	Computer Operations or Operations Management	Replication & Backup Controls	• Identify back and replication configurations to verify the data is backed up and review the logs that indicate their success and failure. Additionally, correlate the failure log events to the IT remediation system of record for proper triage and resolution procedures.

© 2026 Deloitte Development LLC. All rights reserved.

Common use cases for Controls Testing Automation

Domain	Area	Type of Control	Automated Activities
BUSINESS PROCESS CONTROLS	Procure to Pay	Invoice Processing Vendor Maintenance Purchase Order	• Validate that purchases, receipts, and invoices are restricted to defined suppliers in the vendor master file. • Validate all Purchase Orders are approved according to the Delegation of Authority matrix. • Validate 3-way matches on the purchase order, invoice, and goods receipt have been performed. • Identify duplicate invoices
	Fixed Assets	New Asset Request Movements Disposal	• Identify fixed assets improperly expensed • Identify fixed assets not properly approved/authorized by the appropriate level • Identify reconciliations not performed within desired/required timeframe • Identify supporting evidence to validate the valuation of fixed assets
	Human Resources	Employee & Master Data	• Identify changes (e.g., critical field adjustments) and deletions to the employee master files have a review and approval by appropriate personnel. • Reconcile HR system of record to the payroll system • Verify proper approval/authorization received from appropriate level for hours and rates • Verify employee master file includes all required supporting documentation where applicable (e.g., resignation letter, employee change form, background check, new hire authorization, etc.)
	Inventory	3rd Party Reconciliation	• Identify reconciliations not performed within desired/required timeframe
	Order to Cash	Customer Masterfile Credit Management	• Identify additions, deletions, and changes (e.g., critical fields) to the customer master file are reviewed and approved by appropriate personnel prior to the change being made • Verify, prior to the extension of credit, a customer check and credit assessment are performed and approved • Verify, all receivable write-offs are approved by authorized individuals as per the Authorization matrix prior to posting.
	Entity Level Controls	Training and development	• Validate training and compliance requirements via HR employee information system and online learning & development systems.

ADDITIONAL USE CASES

Finance insights engine

Financial planning and analysis

Platforms powered by Gen AI can review and analyze data, identify gaps and suggest ways to fix them, and provide leaders with on-demand insights

Issue / opportunity

Finance work often includes repetitive tasks like pulling reports and reconciling data, much of which is manual and often in spreadsheets. There remain few resources and little time left to focus on the why behind the data or explore multiple what-if scenarios. A Gen AI-powered insights platform could serve as a digital analyst, allowing finance professionals to ask questions in plain language, explore unlimited data sets, and receive custom reports that reveal business performance.

How Gen AI can help

Data consumption at scale
Gen AI opens the potential for leaders to leverage data at a depth and speed far beyond today's possibilities. Operational data and financial data are often inconsistent across an organization and lack a uniform structure. Even key economic indicators like inflation, consumer spending, or interest rates can vary substantively across geographies, sources of truth, or interpretations. Gen AI could quickly reconcile disparate data, analyze against company data, and deliver real-time, insight-rich content that drives strategy.

Faster analysis and performance reporting
Finance professionals could leverage a Finance Insights Engine to support, supplement, and accelerate their work. The engine might identify variances between plan and actuals and explain why they exist—eventually learning to tell more complicated stories deep into the financials. For example, when labor expense comes in higher than forecast, Gen AI can go multiple layers down in detail, considering geography, operational performance, seasonality, special projects, and more, to identify the root cause. Explanations could then be offered immediately in multimodal formats, including text, graphs, charts, or video.

More productive strategy sessions
Imagine holding a planning session to identify needle-moving opportunities for the upcoming year. Today, analyzing core financial metrics for multiple time periods and business lines is a time-consuming and subjective process. With Gen AI-enabled technology at the table, leaders could request and receive ad hoc analyses of operational and financial data from the engine in real time to gain retrospective and prospective insights.

© 2026 Deloitte Development LLC. All rights reserved.

Autonomous close

Controllership

Gen AI could create a true “lights out” close process by improving leader visibility, minimizing rote work, and ultimately managing and completing tasks.

Issue / opportunity

A consistently timely, accurate, and efficient financial close is a challenge. It requires a lot of human power. Short bursts of activity take place throughout the year, but this limits visibility into the close process and often prevents the finance department from focusing on more strategic initiatives.

Gen AI can help eliminate the scramble to get the books closed on time and without errors. It can do the grunt work, categorizing transactions, making journal entries, and generating financial statements so that finance teams can focus on the bigger picture. With time, it might take a bigger role in managing the close process and provide commentary on how the company performed.

How Gen AI can help

Smart reconciliation
Gen AI could reconcile unstructured or inconsistent journal entries or take on more complicated accounts that require supporting thoughts or significant estimates to reconcile. Conversational, Gen AI-powered chatbots might also enable users to input exceptions for remediation at the source, run through next steps, update reconciliations, and consolidate financials.

Perceptive task management
Gen AI could create integrated, automated closing checklists and, in time, it could centrally track and manage all close activities. It could also use prior history to anticipate how journal entries impact others, recognize issues to the close, and proactively reduce or eliminate delays.

Improved variance analysis
Instead of relying solely on quantitative data, human analysts could leverage Gen AI to weave in unstructured data, like meeting notes, news stories, and interviews, to gain a deeper understanding of variances between actuals and forecasts.

Interpretative reporting
Finance teams might set up templates from which Gen AI could produce initial accounting reports. As the technology develops logic to monitor and interpret new or changing regulations, it might start to provide impact assessments and produce more advanced accounting treatments in response.

© 2026 Deloitte Development LLC. All rights reserved.

ADDITIONAL USE CASES

Dynamic risk assessment

Internal audit, controllership, compliance, and risk

Gen AI will continue to elevate risk assessments, driving a streamlined and value-added integrated risk management approach that could transform today's periodic risk assessments into a state of continuous monitoring.

Issue / opportunity

Risk management is critical for an organization's success, from business transformation to ongoing operations. Sophisticated approaches require extensive analyses of processes and data, from qualitative and quantitative sources. The work can be complex, time consuming, and susceptible to human error or unintentional bias.

During risk assessments, leaders in various functions are often interviewed to gain risk-driven insights. However, interview capture and reporting are often performed manually, which could lead to missed or misinterpreted insights and a slow process. Further, new metrics like indicators of cyber risk are emerging that can be more difficult for leaders to grasp.

Risks are also often highly interconnected across organizations, which make monitoring impacts more complex. AI, including Gen AI, could help leaders effectively sense and assess risks to strategy, operations, and other areas in a more dynamic and real-time manner.

How Gen AI can help

Key risk indicators and continuous monitoring
Gen AI may enhance risk management processes by enabling unlimited, simultaneous, and continuous anomaly detection and analysis. The technology could analyze transactions and other enterprise-wide risk indicators in real time and generate immediate reports and insights on potential discrepancies and outliers, allowing for timely risk response and mitigation.

Enhancing risk interviews
Gen AI can analyze unstructured data sources, like interviews, to uncover specific takeaways, themes, and insights. Leaders can then rapidly identify and respond to existing and emerging trends.

Cyber risk monitoring
Organizations can leverage Gen AI to develop an aggregated depiction of cyber risk. With near real-time data that ranges across various dimensions, leaders could better align their thinking and address critical gaps, threats, and opportunities. With time and development, Gen AI-enabled systems might also activate security measures, such as creating action reports, providing recommendations, and notifying users who may be impacted and need to take immediate action.

External risk sensing
Predictive, AI-powered analytics could analyze massive amounts of intelligence—from open sources such as social media, blogs, forums, website reviews, industry newsletters, survey data, and news and then formulate actionable insights. Companies could gain advanced notice of emerging risks, knowledge of potential loss events, and increased awareness of potential threats to their business.

© 2026 Deloitte Development LLC. All rights reserved.

Cash flow forecasting

Treasury

Gen AI can improve the accuracy of cash flow forecasting, reduce manual processes, and provide greater insights to business leaders.

Issue / opportunity

Cash flow forecasting is often a labor-intensive process. And despite the work associated with it, many companies struggle to achieve a reliable forecast. This can lead to companies taking on higher borrowing costs for operations and potentially missing investment opportunities. Gen AI offers the potential to reduce the manual effort of data aggregation and increase the accuracy of the forecast output, ultimately saving costs and enhancing returns.

Data sets often reside across multiple systems in structured and unstructured formats. A Gen AI-enabled solution can aggregate all sources into its analyses. It might also begin to own part of the process. When gaps or inconsistencies in the data arise, the technology might research and resolve issues by following a set workflow (e.g., prompting sales representatives with requests for sales forecast confirmation) or leveraging historical trends and probabilities.

Finance teams could access unlimited scenario-based insights and predictions, allowing them to focus less time on generating reports and more time on analyzing potential impacts.

How Gen AI can help

Exponential data consumption: Gen AI can process and interpret data at unprecedented scale and speed. It can ingest and analyze historical company data as far back as it dates and can also factor in external data from various sources, in multiple formats. Collectively, richer data forms the foundation for the cash flow forecast, leading to more robust analyses and more accurate forecasts.

Predictive analyses: Gen AI can identify the biggest drivers of cash flows and utilize a larger sample of parameters to forecast future cash flows more accurately.

For accounts receivable, this might include factoring in customer trends, such as average delay, percentage of payments delayed, average number of invoices per payment, total open amounts, and time between payments. Additionally, it could consider invoice factors, such as previous payment times, month due, day of the week due, invoice value, and total current invoice value. It could also keep a pulse on public data and extract economic patterns and customer activities that might impact future cash flows. This additional level of granularity and ability to predict with precision can offer business leaders more confidence in their plans.

For accounts payable, this might include projecting expected trade payables factoring in specificities related to vendors, based on importance and payment terms. For larger cash outflow drivers, such as taxes or payroll, this could involve correlation of data from other sources (e.g., financial statements projections for taxes or Human Resources information for payroll) to enhance forecast accuracy.

Foreign exchange assessment: Gen AI can continually monitor international markets, factor volatility into its forecasting, and develop hedging strategies. Armed with this information, leaders can gain more confidence that their associated decisions are rooted in reliable data.

Variance reduction: With manual processes, forecasting relies on different perspectives to provide, review, and analyze historical financial data. Gen AI can streamline and standardize the process, leading to a significant reduction in potential for error variance to actual results. Forecasts could be further enhanced with integrated visualizations to improve interpretation and confidence, quickly and with less overall effort.

© 2026 Deloitte Development LLC. All rights reserved.

Order to cash

Transactional finance

A mix of AI can fundamentally transform traditional order to cash processes. AI, Gen AI, and machine learning can automate and improve tasks and workflows across the order to cash cycle, resulting in cost savings and faster collections.

Issue / opportunity

Order to cash is the backbone of a business and a critical component of the working capital value chain. The order to cash cycle is made up of several sub-cycles, many of which are highly manual today. This workflow is ripe for Gen AI-powered transformation, through which companies can better understand customer credit risk, shorten sales cycles and days sales outstanding, and increase overall process efficiencies.

How Gen AI can help

Automated orders: AI and ML can eliminate most of the manual tasks across the order to cash cycle. Automated data collection, collation, and interpretation can reduce the time spent on customer onboarding, data management, and deal closing. ML-driven smart quote generation can significantly reduce processing time on quotes and renewals. Once a sale has been approved, AI can create an invoice and order fulfillment request based on customer contract terms and standard policies and procedures.

Customer credit risk analysis: Businesses want to know who they are selling to and how likely that person is to pay on time, with accuracy. Gen AI can evaluate credit risk by analyzing customer data and credit history to help identify high-risk customers, improve credit decision-making, and reduce costs associated with bad debt. Based on the risk analysis, Gen AI can tailor sales offers based on the risk category of customers.

Faster collections: Collections today is labor intensive, phone calls and emails with invoice questions, overdue reminders, and other dispute intervention, often repeatedly. Leading organizations are already leveraging AI-enabled virtual assistants that use natural language processing (NLP) to enable self-service customer payments and collection activities by phone and chat, in some instances pairing it with ML-enabled recommendation engines to offer customized offers and payment plans. Gen AI and ML are likely to further expand the capability of these virtual assistants soon by tracking collections and work lists, automating dunning letters and calls, making and documenting collectors' calls, providing collections agents with recommended next actions in real time, running potential discount analyses, and automating cash postings. They could also understand payment trends and predict exceptions to get in front of them proactively.

© 2026 Deloitte Development LLC. All rights reserved.

Engage with my tax data

Tax

Gen AI can enable tax professionals to access, analyze, and gain insights from their tax data by automating the process of data extraction, transformation, and loading. This can reduce the time spent on routine tasks, thus allowing professionals to focus on deriving insights from the data.

Additionally, Gen AI can help compare organizational tax data against publicly available industry data for benchmarking. This comparative analysis can provide valuable insights to assist with strategic decision-making.

Issue / opportunity

Tax data users rely on structured and unstructured data and face challenges in accessing, cleansing, reconciling, and getting data fit for purposes for tax analysis. These steps add lead-time and knowledge requirements necessary to locate and prepare the data.

Gen AI can offer tax professionals real-time and efficient insights into their tax data and delivers a more personalized experience by integrating with existing systems. User-friendly interfaces provide nontechnical users with means to understand complex tax data. It also enables standardization of operational tax data, which can make tax processes more efficient and provide a basis for strategic advice to other business areas.

How Gen AI can help

Streamlined data access

Gen AI can automate the process of data access through chatbots and applications. It can quickly locate specific data points or reveal key gaps, like undetected research and design (R&D) credits or nexus states, within the company's vast tax databases, ensuring that users get accurate information without the need for manual searching. Leveraging AI to rapidly process vast amounts of data and knowledge reduces the time required to go from question to answer.

Comparative analysis

By linking Gen AI with a company's tax data, it can run analyses like flux or period-over-period provision in seconds, while simultaneously linking into publicly available competitor tax data from public financial statements to help guide internal financial strategy adjustments. AI can highlight disparities, trends, and opportunities, providing valuable insights for strategic decision-making.

Generate draft tax memos

AI can generate initial draft tax memos like controversy responses, tax-planning memos, and provision footnotes by automating research of relevant tax precedents, regulations and standards, analyzing and considering tax sensitivity, and then summarizing findings with citations and documentation. This can result in expedited writing processes, time savings, and improved consistency between documents as it can adhere to predefined guidelines.

Investor communications

Investor relations

Gen AI can be used to create consistent, standardized investor communications in multiple formats with minimal manual effort.

Issue / opportunity

Investor relations (IR) is complex and dynamic. Beyond just earnings call preparation, IR teams prepare for investor conferences, field calls from institutional investors and analysts, assist with corporate strategy and public relations, and more.

The future of IR with Gen AI is spending minimal time drafting communications, instead focusing on getting the message right for the audience.

How Gen AI can help

Pull in more data, quickly: Gen AI can process and index large volumes of financial data to identify and extract crucial key performance indicators, such as a particular fund manager's moves in or out of your company's stock versus your peers. It can then recognize key topics to emphasize, create a storyline flavored with public data like SEC filings and economic reports, and produce materials that convey intended messages.

Ensure consistency: Drawing from historical communications and guidelines, Gen AI can produce investor communications that maintain a company's style and tone. Packages might include draft scripts for a company's quarterly earnings calls, investor day presentations, analyst responses, SEC filings like 8-K and 10-K, annual reports, or strategic announcements that follow a consistent narrative.

Predict analyst and market responses: As Gen AI advances, it might be used to gather intelligence from the market. The technology might identify influencers, examine the types of questions they tend to ask, and prepare draft responses. A Gen AI-enabled digital assistant might be used to listen live to analyst questions and suggest a response in real time, complete with a visual like chart or graph to visualize the answer.

Prepare targeted messages: Today, teams of analysts' pore over data to prepare leaders for investor presentations. Gen AI could assist and tailor messaging for key audiences by continually scanning publicly available sources. The result? Leaders arrive prepared with up-to-the-minute, customized, and detailed materials.

Stay ahead of the curve: Business moves quickly. It is important that leaders monitor their companies' and their competitors' investor bases, over time and in the moment. Are activist investors seeking influence? How best to protect market share? Gen AI could increase the capacity to scrub transcripts and quarterly releases, identify trends, and produce objective insights.
